Developments such as these have implications for the various key stakeholders within education systems. In particular, teachers, especially those in senior positions, have to see themselves as having a wider responsibility for all children and young people, not just those that attend their own schools. They also have to develop patterns of working that enable them to have the flexibility to cooperate with other schools and their wider communities. It means, too, that those who administer area school systems have to adjust their priorities and ways of working in response to improvement efforts that are led from within schools.

Some form of local coordination is needed in order to encourage such forms of collaboration ([Armstrong and Ainscow, 2018](#)). Indeed, a recent report noted that four of the most successful national education systems—Singapore, Estonia, Finland, and Ontario—each has a coherent “middle tier”, regardless of their differing extents of school autonomy or devolution of decision-making ([Bubb et al., 2019](#)). In particular, they all have district level structures that offer a consistent view that, to maintain equity as well as excellence, there needs to be an authoritative co-ordinating influence, with local accountability.

Making sense of the process

Underlying these ways of using collaboration to promote equity within education systems is a common pattern. Most importantly, they involve an engagement with evidence collected by practitioners with support from university researchers. Usually, this begins with a consideration of an established set of practices that are largely taken for granted. An interruption occurs that problematizes these practices and provokes consideration of why current practice is the way it is and how it might be improved. This may then lead to actual changes in practice.

Given my focus on the possibilities of developing more equitable ways of working, this pattern begs two important questions:

- What is it that provokes the problematization of established practice?
- And why does this necessarily lead to more inclusive ways practices?

In addressing these questions, we have found it helpful to draw on a range of theoretical resources. One that has proved particularly powerful is the idea of “communities of practice”, as developed by Wenger (1998), focusing specifically on the way he sees learning as “a characteristic of practice”.

Wenger explains practice in terms of those things that individuals within a community do, drawing on available resources, to further a set of shared goals. This goes beyond how practitioners complete their tasks, to include, for example, how they make it through the day, commiserating about the pressures and constraints within which they have to operate. Practices are thus ways of negotiating meaning through social action, which underlines the importance of the conversations embedded in teachers’ day-to-day work, referred to earlier in this paper.

In explaining this process, Wenger argues that communities ‘reify’ their practices by producing concrete representations of them, such as tools, symbols, rules and documents (and even concepts and theories). However, these reifications have to be given meaning through a process of participation, which consists of the shared experiences and negotiations that result from social interaction within a purposive community.

Wenger offers some helpful guidelines for judging whether a particular social collective can be considered as a community of practice. Since such a community involves mutual engagement, a negotiated enterprise, and a repertoire of resources and practices, then its members should be expected to:

- Interact more intensively with, and know more about, others in the group than those outside the group;
- Hold their actions accountable (and be willing for others in the community to hold them accountable) more to the group’s joint enterprise than to some other enterprise;
- Be more able to evaluate the actions of other members of the group than the actions of those outside the group; and
- Draw on locally produced resources and artifacts to negotiate meaning, more so than those that are imported from outside the group.

By these criteria the staff teams in the studies reported earlier can, to varying degrees, be seen as communities of practice. Much of the evidence for this assertion rests on what was witnessed of the ongoing and informal interactions between groups of teachers. So, for example, amongst staff inquiry groups, hours of meetings, shared experiences and informal discussions over hurriedly taken lunches were observed. These sometimes involved the development of particular meanings of frequently used phrases, such as “raising standards”, “equity” and “inclusion”. These shared meanings help to define a teacher’s experience of being a teacher. In the same way it can be assumed that groups of colleagues doing similar work in another school have their own shared histories that give meaning to being a teacher in that particular context.

There is no reason to suppose that teachers are conscious of such processes for the most part, though occasionally they may be able to articulate their importance for developments in their schools. What was significant in some of the project schools, however, was not simply the high level of collaboration that was claimed by the teachers (such claims can, of course, be challenged), but the implication that “good practice” is defined through such collaborative processes. In these contexts, good practice is defined not by what researchers or policy-makers say, or others do elsewhere, but by what “we” think “works here”.

Once again, the notion of communities of practice is important here in that it views practice as being intimately bound up with the norms, values, beliefs and assumptions of a group of teachers, in a particular school context. The implication is that practices cannot be understood—or, more to the point, changed—without also understanding and changing those local patterns. What is needed is something that disturbs existing assumptions and provokes some sort of reformulation, both of practice and of the thinking on which it is based.

In the context of the collaborative research processes I have described, disturbances often come from an engagement with evidence generated within a school that helped to make the familiar unfamiliar. Sometimes, too, they arose from outside the school in the shape of a planned intervention—a report from the university group to the school inquiry team, or a visit to another school. However, the communities of practice idea suggests that meaning-making does not depend on such planned and structured events but is an ongoing process, as groups of teachers come to terms with new situations, new disturbances and new perspectives.

Anomalies and organizational learning

This relationship between practice and local meaning-making suggests that external agendas cannot simply be ‘imposed’ on communities of practice. Specifically, external proposals for change, however powerfully enforced, have to be endowed with meaning within local contexts before they can inform practice. This implies that schools (or, at least, the communities of practice within schools) may well negotiate local meanings for those agendas that are different from those of the formulators themselves or, indeed, of other schools.

The significance of communities of practice is usefully summed up by Wenger when he argues:

Communities of practice are not intrinsically beneficial or harmful.... Yet they are a force to be reckoned with, for better or for worse. As a locus of engagement in action, interpersonal relationships, shared knowledge, and negotiation of enterprises, such communities hold the key to real transformation - the kind that has real effect on people’s lives... The influence of other forces (e.g. the control of an institution or the authority of an individual) are no less important, but they are mediated by the communities in which their meanings are negotiated in practice.

Wenger (1998, p. 85).

There is, however, an important caveat here. Communities of practice “are not intrinsically beneficial or harmful” precisely because the values and assumptions to which they will subscribe are determined locally. In terms of the development of practices, there is nothing inherent in even the most dynamic community of practice which predisposes it towards generating more equitable outcomes. Indeed, a dynamic community that defends the status quo or moves rapidly in a non-inclusive direction is entirely conceivable. So, for example, Yurkofsky et al. (2020) argue:

Educators who believe in supporting equitable schools can still carry implicit biases that affect their practices, and teachers who aspire to improve their pedagogy may in practice have trouble giving up the belief that external factors (e.g., parental and neighbourhood influence) - as opposed to their own actions as teachers - are the primary determinants of students’ achievement (p. 415).

What, then, makes the difference between instances where collaborative meaning-making create a potential for the development of inclusive practices and those where such practices actually arise? For this, two sets of concepts from the literature on organizational development are helpful: Argyris and Schön’s (1996) idea of “single and double-loop learning”; and Skrtic’s (1991) distinction between bureaucracies and adhocracies, together with his notion of the recognition of “anomalies” as the catalyst for the transition from one to the other.

Argyris and Schön argue that organizations are capable of learning, but to different extents and, indeed, at different levels. What they refer to as single-loop learning takes the form of what in an educational context might be called the improvement of existing practices, but without any fundamental reconsideration of the assumptions upon which those practices are based. On the other hand, double-loop learning asks questions about the underlying aims of practice and about the implicit theories which underpin it.

To take an example, in the first year of the Stockborough Equity Research Network, described above, discussions involving the head teachers led to an agreement that equity was a central issue facing each of the partner schools. It soon became evident, however, that what this meant was different in each context, not least in respect to the groups of students who were seen as a cause for concern. As a result, it was decided that the work of the network would focus attention on those learners thought to be “missing out” within existing arrangements. This led to a concern amongst our university team that this might lead to narrowly focused efforts to “fix” students seen as being in some sense inadequate. However, collecting evidence about these groups eventually led to a process of double-loop learning that re-focused attention on an analysis of contextual factors that were acting as barriers to their participation and learning. In this way, most of the projects gradually became whole school improvement efforts that had the potential to benefit many students.

Skrtic also presupposes a fundamental distinction in the way organizations solve problems. He argues that bureaucratic organizations deal with such problems by creating different sub-units and specialisms to contain them, leaving practice elsewhere in the organization undisturbed. So, for example, a school may decide to establish a separate unit to deal with the problems of disruptive behavior, such that it avoids the need to examine ways in which its own practices may have helped to generate these problems. On the other hand, what Skrtic calls adhocratic organizations see such problems as an opportunity to rethink their existing practices in fundamental ways. Moreover, he argues that bureaucratic organizations can become adhocratic if enough of their members recognize “anomalies” in existing practice.

It seems, then, that faced with some form of disturbance—what I referred to earlier as an interruption—some schools will close the problem down and make largely technical responses. Others may open the problem up and use it as the basis for a critical interrogation, and reformulation of practice and the assumptions on which practice is based. However, as Skrtic argues, someone has to recognize a problem as an anomaly and convince others.

Although the notion of communities of practice would encourage an emphasis on the collaborative nature of such recognition, there is no doubt that individuals can also be powerful inhibitors or facilitators. Here, the leadership style and practices of senior staff are important. So, for example, Lambert et al. (2005) write about the importance of “constructivist leadership”, which can engage colleagues in what was characterized earlier in this chapter as shared meaning-making.

A further important factor appears to be access to evidence and alternative perspectives which lie outside current assumptions and constitute a basis on which they can be problematized. This is where the involvement of external research partners who provide critical interventions can be so important as those in schools come to terms with data they have collected. A similar process can occur through school-to-school collaboration.

Here, again, we are in the territory of communities of practice, where processes of meaning making in a particular community and in the local context of that community are at work. In other words, “what we see working here” is more important than what others tell us to do. However, in this case, established patterns of practice and meaning are disturbed sufficiently such that distinctly new patterns begin to emerge.

Social learning

This way of thinking is based on the idea that schools and their local communities have untapped potential to improve their capacity for improving the achievement of all of their students, not least those from economically poorer backgrounds. The

challenge therefore is to mobilize this potential. This reinforces the argument that school improvement is a social process that involves practitioners in learning from one another, from their students, and from others involved in the lives of the young people they teach.

In thinking about how this thinking might be used more widely it is essential to recognize that it does not offer a straight forward recipe that can be lifted and transferred from place to place. Rather, it defines an approach to improvement that uses processes of contextual analysis in order to create strategies that fit particular circumstances. This involves an engagement with various forms of evidence, leading to the development of locally determined improvement pathways. In this way, those involved probe beneath the surface of headline performance indicators to understand how local dynamics shape particular outcomes for students. In so doing, this helps to identify barriers to progress and resources that can inject pace into efforts to move things forward. What is distinctive in the approach is that it is mainly led from within schools, with senior school staff having a central role as “system leaders” (Hopkins, 2007). And, as argued earlier, this requires new thinking, practices and relationship across education systems.

It is predictable that such changes will lead to periods of organizational “turbulence” (Hopkins et al., 1994). The nature of this phenomenon will vary from place to place, but in general it arises as a result of the reactions of individuals to ideas and approaches that disrupt the status quo of their day-to-day lives. It is worth noting, however, that there is research evidence to suggest that without periods of turbulence, successful, long-lasting change is unlikely to occur (Fullan, 2007). In this sense turbulence can be seen as a useful indication that things are on the move.

The nature of practice

There is one further factor at work, which may be more fundamental. We are familiar with the notion that professionals operate in arenas characterized by complexity and uncertainty, such that their practice must constantly adjust to new and unique situations (Eraut, 1994; Schön, 1983/1991). As Eraut notes, this creates a significant problem, given the tendency of human actors to routinize their actions:

The development of routines is a natural process, essential for coping with the job and responsible for increased efficiency; but the combination of tacit knowledge and intuitive decision-making makes them difficult to monitor and to keep under critical control. As a result, routines tend to become progressively dysfunctional over time; not only do they fail to adjust to new circumstances but ‘shortcuts’ gradually intrude, some of which only help professionals to cope with pressure at the expense of their clients.

Eraut (1994, pp. 111–112).

The “clients” of teachers are, of course, their students. However, not only are these students active participants in the schooling process—making their views and feelings known, sometimes in no uncertain terms—but the aim of teaching is to elicit some sort of response from them, whether that be in the form of long-term outcomes or immediate classroom behaviors. If, as Eraut suggests, teachers’ routines become progressively dysfunctional, then the desired responses from students will fail to materialize. This situation will be exacerbated where students are less reluctant to make their dissatisfaction known to their teachers, and where teachers and schools are held tightly to account for delivering certain sorts of outcomes.

The implication of all this is that there is an in-built dynamic which brings teachers face-to-face with a mismatch between their routinized practice and the actual responses of their students. If inclusion is understood as a process of reducing barriers to learning and participation, then it seems reasonable to suggest that this in-built dynamic also brings teachers face-to-face with the non-inclusive nature of their practices. If we then go on to see school staffs as consisting of communities of practice, we can see how a core task of such groups is to develop shared meanings (and therefore practices) around the recurrent experience of mismatch between established practices and the realities of their students. This does not mean, of course, that every mismatch will be acknowledged as an “anomaly”, or that the shared meanings that are developed around them will lead to more inclusive practices. However, it does mean that fundamental questions about inclusiveness arise and can potentially be made explicit as a matter of course in *every* school, regardless of whether or not those involved espouse a rhetoric of inclusion.

Our work suggests that this is not a merely theoretical possibility. In some of our project schools we saw how a mismatch between established practices and the actual outcomes of that practice became apparent. This might relate to a group of students whose exclusion from classrooms ceases to be taken for granted, or those who “disrupt” established practices, or students who “fail” to reach desired targets. We have also worked with schools where shifting demographics produced intakes that responded differently to the schools’ traditional population, or classrooms in which individual students seemed to be doing less well than their teachers hoped, or experiences of new practices which suggested to teachers that their students could do better if they abandoned their existing ways of working.

Final thoughts

The research summarized in this chapter points to the sorts of conditions that are needed in order to use processes of collaboration to foster equity within education systems. As I have explained, this is based on the idea that schools have untapped potential to

improve their capacity for improving the achievement of all of their students, particularly those from poorer backgrounds. The challenge therefore is to mobilize this potential. This reinforces the argument that school improvement is a social process that involves practitioners in learning from one another, from their students, and from others involved in the lives of the young people they teach. As we have seen, an engagement with evidence can be a powerful catalyst for making this happen.

A helpful theoretical interpretation that can be made of these processes is that, together, they help to strengthen social capital. In other words, they create pathways through which expertise and lessons from innovations can spread. In recent years, the work of Robert Putnam has been influential in making the idea of social capital a focus for research and policy discussion. He explains:

Whereas physical capital refers to physical objects and human capital refers to the properties of individuals, social capital refers to connections among individuals – social networks and the norms of reciprocity and trustworthiness that arise from them.

Putnam (2000, p. 19).

Writing about the United States, Putnam states that “what many high-achieving school districts have in abundance is social capital, which is educationally more important than financial capital” (p. 306). He also suggests that this can help to mitigate the insidious effects of socioeconomic disadvantage.

It seems, then, that a major factor in determining success in promoting equity in education is our ability to strengthen social capital. Therefore, the task of those involved in leadership roles is to create the climate that will support such developments.

This means that equitable education systems must be connected systems, and that schools have to work together, and with others, both within and beyond their local areas. It also points to the vital role of local area coordination in promoting greater equity. It shows, too, that pursuing arrangements that are more equitable does not always mean schools individually doing more. However, as I have argued, it does imply partnerships beyond the school, where partners multiply the impacts of each other's efforts.

Finally, there are significant implications here for national policy makers. To support the promotion of greater equity, they need to develop policy that can learn from and nurture innovative developments. They also have to determine how they can foster the conditions needed to encourage the interpretation of policy on the ground in ways that promote the principle that all learners matter and matter equally.

Acknowledgments

Many colleagues have contributed to the programme of research described in this paper, too many to mention. However, the ideas of Alan Dyson were particularly important to the argument I develop.

Introduction

It is hard to imagine any sustained debate about education reform in which the word “accountability” would not be used. Usually, it is interpreted negatively as unhelpful pressure on schools and teachers. This is because it is generally associated with public accountability: results, league tables and inspection. But accountability in its truest sense is much broader and more important than that. A system of professional accountability operating at the level of the individual teacher, the individual school and across networks of schools can provide a source of professional aspiration and improve teachers’ knowledge, skills and practice so that children are supported better in their learning. It provides important support for professionalism in schools, teacher development and school improvement. As such, it deserves championing as an essential and even energizing element of any school system.

Defining accountability

The word accountability has fallen into disrepute among professionals over the years because it is too often understood as something imposed on schools by external authorities. Many now suggest it should be replaced by the word “responsibility,” which does not carry the same pejorative connotations. Although the two words “responsibility” and “accountability” are often used interchangeably, there is a subtle difference in meaning which is important and should not be lost.

Responsibility is best explained as a duty to take care of something. Each individual’s sense of responsibility differs and stems from their experiences, their beliefs and personal values. The term “accountability” assumes responsibility but it does more than that. It describes a relationship whereby one party—such as an individual, an institution or another entity—has an obligation to account for their actions or performance to another (Brundrett and Rhodes, 2011). Put simply, they are answerable to someone and there are expectations—whether explicit or not—related to that. The obligation assumes that whoever is giving account, and being held to account, has some responsibility for the actions or performance. They might therefore be considered worthy of praise or blame. So, accountability involves responsibility, expectations and accounting, which may be evaluated against established or expected standards and action taken. Responsibility is the more personal concept, with people feeling an intrinsic sense of responsibility, for individual children, for example. Giving an account is seen as a less personal, more systemic concept (Mongon and Chapman, 2012).

The key question for schools is: who are they accountable to and for what? In their exploration of accountability in education, Earley and Weindling (2004) identify four relationships for schools. Each relationship signals some sort of stake in the outcomes of education and, therefore, expectations of schooling. Schools have responsibilities for and have to account to:

- Pupils—and, I would add to parents and the local community (*moral accountability*)
- Colleagues (*professional accountability*)
- Employers or government (*contractual accountability*)
- The market, where clients, such as parents, have a choice of institution (*market accountability*).

These four relationships encompass two key approaches to accountability. The first is a performance or productivity model which emphasizes outputs such as test and exam results (Elliott et al., 1981) or outcomes. The second is an improvement or process model

which focuses on school evaluation, opening practice to debate and critique. The purpose of the first approach, which would be characterized as a summative model, is to prove quality—it emphasizes what has been achieved. The purpose of the second model is more formative as it is designed to improve quality (Hopkins, 2007).

In England, the first model is well embedded in the current public accountability framework. The most hostile perception of this model is that it is based just on a centralized regime of data, tests and inspection, set by government and, invariably, negative, mechanistic and stressful. The model is generally now described as high stakes accountability, with sanctions or rewards for those being assessed or judged, whereas low stakes accountability provides information without direct actions linked to results.

Ten years ago, when I left Ofsted, England's inspection organization, where I had been Chief Inspector for 5 years, I presented the case (Gilbert, 2012) for a better balance between the two models. I continue to believe the second model needs to assume greater importance as it offers more leverage for change. However, in systems where accountability is as high stakes as the English system, balance is not possible as the first model is so deeply embedded. I am not arguing for the end of an external accountability system; we need one that not only gives an account at system level, without the current pressures, but also supports improvement to the system by contributing to teachers' and schools' professionalism. This should be more supportive of their work and result in greater ownership of the accountability system.

The best school leaders embrace both forms of accountability but with a working emphasis on the second. Elmore's research (2004: 134) indicates that schools with strong internal accountability, "a high level of agreement among members of the organization on the norms, values and expectations that shape their work," do well within the public accountability system. The word "high" is implicit here in front of "expectations." He (2004: 134) also highlights that schools with weak internal accountability, "low agreement and atomization," tend not to perform so well. Elmore's definition of a strong professional accountability system within schools is what I am using in this chapter and this is explored more fully in [Developing a system of professional accountability](#) section.

Accountability and professional practice

There is a wealth of research in health about responsibility and accountability at the individual, the organizational and the whole system level. This is far more extensive than for education, perhaps because the consequences of practice mistakes and failure can be so obviously life threatening. We can learn from the experience of other professions. Eraut's research (1994) focused on all professions and he described professional practice as autonomous and self-regulating, with individual professionals accountable firstly to themselves. He argued that professional accountability should be drawn from a commitment to service and should include:

- A moral commitment to serve the interests of clients
- A professional obligation to self-monitor and to periodically review the effectiveness of one's practice
- A professional obligation to expand one's repertoire, to reflect on one's experience and develop one's expertise
- An obligation that is professional as well as contractual to contribute to the quality of one's organization
- An obligation to reflect upon and contribute to discussions about the changing role of one's profession in wider society (Eraut, 1994: 236).

Written nearly 30 years ago, this provides a view of professional accountability that could not be more relevant in education today. It underlines the importance of the individual's accountability for the quality of their own work and to the people the profession serves. It points to the significance of school leaders and teachers as agents of their own accountability and the need to develop an internal system of professional accountability in schools, with clear roles for teachers and, indeed, for all those involved in the education community.

The impact of public accountability systems

Schools are publicly funded organizations and so governments are expected to account for the quality of education they provide. In establishing public accountability systems, governments want to ensure that public money is being well spent on high quality education. They—and the organizations that serve the systems—invariably have a belief too that accountability itself contributes to improvement in education. For example, when first established, Ofsted took on the strapline, "Improvement through Inspection" changing it in 2006 to "Raising standards, Improving Lives," when it extended its inspection remit and also assumed regulatory responsibilities.

The research evidence, however, is mixed, with many accountability systems showing both benefits and problems. Research is also restricted by the limited nature of the evidence base, particularly as the details of inspection frameworks change so frequently. Nevertheless, a search of the literature provides evidence of impact, both negative and positive, which is important contextually in shaping a different system. Consequently, I outline below significant findings about its impact on leaders and teachers, curriculum, pupils and groups of pupils.

The overriding message from an analysis of much of the evidence is that the impact of external accountability systems stems from the pressure they generate on the organizations being held to account and on the people within them. Pressure can be productive, but it can also have negative and unintended consequences.

Matthews (2014) argues that inspection raises standards by defining high expectations for effective schools and assessing practice against them. Ehren (2016), in summarizing the findings from a range of international empirical research, identifies ways in which inspection can impact on school improvement. Several of these research studies indicate that when the outcomes of inspections are negative, greater improvement results. Ehren also highlights the influence on schools' practice of the standards inspectors use to assess quality and the pressure on leaders from the prospect and consequences of either inspection failure or reward. There are considerable risks relating to such standardization, in particular that it can lead to conformity and compliance, as well as distracting schools from developing a culture of professional learning (Ehren, 2019).

Using online survey data from approximately 2300 principals in seven European countries, Altricher and Kemethofer (2015) also looked at whether the accountability pressure generated by school inspections promoted school improvement. School leaders in high stakes systems, such as England, reported more pressure than low stake systems such as Austria and Switzerland. They found that school leaders who feel more pressure to do well in inspections also took more account of the quality expectations established by inspections. These leaders also showed more sensitivity to stakeholders' reactions to inspection and undertook more development activities in their schools both pre and post inspection. However, pressure was also found to be detrimental to development; school leaders experiencing most pressure identified unintended consequences, such as narrowing of the curriculum and the discouragement of innovative teaching strategies.

A literature review on the impact of accountability (Brill et al., 2018) found it could stimulate the development of teachers' skills to engage well with assessment data in order to improve teaching and learning. Such professional development is positive. However, the accountability system (Lynch et al., 2016) is also experienced as a source of frustration and additional workload for teachers. It is seen as impacting on job satisfaction and lowering morale, including resulting in some teachers leaving the profession early. Wilkins (2011) reports a generational shift in attitudes to accountability with new teachers and those early in their careers seeing it as a core part of the job. Certainly, 10 years on, in the English system there are very few teachers who haven't grown up with a strong system of external accountability deeply embedded in the school system. This needs to be considered in any move to a system driven more strongly by professional accountability.

There are numerous studies reflecting widespread concern about the impact of external accountability systems on the curriculum. The literature review (2018), referred to above, identified concerns about a focus on literacy and numeracy at the expense of a broad and balanced curriculum and also a tendency to "teach to the test." The review found that this was particularly the case when the accountability measures concentrated on pupil performance in a limited range of subjects.

International benchmarking, for example that provided by survey results from PISA, TIMSS or PIRLS, can have an impact on system-wide accountability. It has influenced national discussions about curriculum and led to reforms in some countries. For example, it has been seen to have a direct impact on national education policy and provision. Japan, a consistently high performer in PISA, responded to its decline in the PISA rankings by revising "key competencies" within its national curriculum and placing greater emphasis on cross-disciplinary skills such as independent thinking (Nakayasu, 2016). These were more in line with the skills PISA aimed to measure.

A narrowing of the curriculum is problematic for all children but is likely to have greatest impact on low performing pupils. Often these consequences are unintended. For example, a report on the Welsh education system (OECD, 2014) highlights the danger of a performance target for pupil attainment, laudably aspirational, leading to schools focusing attention on pupils just below that required target level. This might well have the unintended consequence of very low attainers, often including many disadvantaged pupils, being among those left out. The performance target was at variance with the Welsh government's other reform objective of reducing the impact of deprivation on pupil performance.

In Australia too, a similarly negative effect on the curricular experiences of children was identified (APPA, 2010, cited in the 2018 literature review), with the suggestion that parents of low-performing children were discouraged from allowing them to take the test.

These examples point to ongoing concerns about unethical practices and "gaming the system."

Much research draws attention to the close relationship between public accountability and pupils' standards of achievement, with the latter often being used as a way of measuring educational quality. For example, research undertaken by Burgess et al. (2013) tested the hypothesis that the abolition of school performance tables, often described as league tables, negatively affects school effectiveness. Comparing outcomes in England and Wales before and after the abolition of tables by the Welsh government in 2001, they concluded that this change markedly reduced school effectiveness in Wales. Standards in secondary schools fell and the gap between Wales and England widened. They also found heterogeneity across schools, with those previously in the top quartile of the tables showing that abolition had no effect on results; no effect was seen either when analyzing by ability or by socio-economic status.

Brill et al. (2018) report the potential of the public accountability system for both increasing or reducing the attainment gap. For example, just as narrowing the curriculum can impact on low attaining pupils, often the most disadvantaged, so too will the tendency to focus extra support on those pupils who are most likely to contribute to the achievement of targets. There is evidence that pupils also become less engaged when emphasis is given to some groups at the expense of others.

Groups of pupils working below the expected achievement threshold are at risk here. The Bew Review (DfE, 2011), which looked at the English system of key stage 2 testing (for children aged 10–11 years), assessment and accountability, drew attention to the concern that the accountability system discouraged schools from admitting pupils with special educational needs and the difficulties of addressing this concern. On the positive side, there is evidence that data collected and used for accountability purposes can be used to target additional, funded support for lower performing pupils. In Japan, for example (OECD, 2012), additional teachers are allocated to those low-performing schools which have a greater number of disadvantaged pupils.

Research evidence has highlighted test anxiety as a potential consequence when pupil assessment features strongly in accountability regimes. Goodman and Burton (2012) suggest that disadvantaged children, in particular, may be affected by anxiety and pressure. Kuramoto and Koizumi (2016) argue that tests in the Japanese system are perceived to lead to a competitive classroom atmosphere and anxiety. However, given the many other factors that may influence pupils' experiences of assessment, the NFER Review concludes that it is difficult to assess the extent to which it is testing, carried out for the purposes of accountability, that causes anxiety.

While national accountability frameworks clearly have value in establishing transparency and giving public confidence about whether public money is being well-spent and schools are delivering high quality education, there is little evidence that external accountability systems are the major driver of improvements in pupil and school performance. Nevertheless, key stakeholders, such as parents, value the information provided and use it to inform choice. Governments might improve public accountability frameworks but they are unlikely to abandon them. It is important, therefore, for policy makers to consider the many ways in which transparency can be provided to the public without such unproductive pressure on teachers and schools and in ways that support professional accountability.

A range of different approaches, some of which are referenced in 5.7 below, could continue to provide public reassurance and also contribute to the development of professional accountability within and across schools. These systems could still monitor schools and identify those requiring intervention and intensive support. They could both prove quality but focus more on improving it too.

Developing a system of professional accountability

The shift in culture and practice needed

As indicated earlier, schools manage a range of accountability relationships. Particularly in England, the focus of the last 30 years has been on accountability to government or employers (*contractual accountability*) and to the market (*market accountability*) where parents have a choice of school. If we are to create a strong system of professional accountability which supports teachers and schools as they improve learning, greater leverage for improvement has to come more directly from accountability to pupils (*moral accountability*) and to colleagues (*professional accountability*). It has to come too from the external accountability framework.

Professional accountability requires an emphasis on both the individual teacher and the school. Schleicher (2018) describes jurisdictions such as Ontario, Finland, Japan and New Zealand as placing greater importance on the development of professionalism and collaboration. In some systems, such as Singapore, teachers' annual appraisal includes not only their contribution to the academic and character development of their pupils but also their collaboration with parents and community, and their impact on their colleagues and the school as a whole. In Shanghai, each teacher's appraisal focuses not only on how well children have been taught and what they have achieved but on the teacher's contribution to the profession or wider education system. These approaches to accountability recognize the importance of individual professional accountabilities in driving change and innovation at system level.

In any system, it is the teachers themselves—in particular through the quality of their teaching and their relationship and interactions with pupils—who make the most difference to pupils' learning. Teachers themselves have to be at the center of any internal accountability system. They have to own it and drive it. They must feel supported by it. As Matthews (2014) argues, "Ultimately, accountability of a profession rests with the professionals. The more they can manage their own quality control and continuing improvement, the less need there should be for external inspection" (2014: 28).

The best school leaders establish a culture that enables teachers to feel greater ownership of all forms of accountability and see it as something that supports their work. They encourage teachers to develop a strong sense of both individual and collective purpose and to feel part of a professional learning community where a continuing process of review and dialog about pedagogy and practice leads to change, innovation and better learning for pupils. An open and trusting analysis would include dialog about things that are not working well and using this to learn and develop professionally. So, a system of professional accountability, rooted in moral purpose and professionalism, requires us to move forward in a number of ways:

- Creating a shift in mind-set and culture so that accountability is professionally owned rather than being seen as externally imposed
- Using accountability as a force for learning to energize schools, motivate teachers and grow their self-efficacy, thereby building professional and social capital, and so system capability and capacity
- Using data, evidence and observation to support organizational improvement, particularly in relation to teaching and learning
- Ensuring school evaluation is a dynamic and inclusive process, which involves pupils, parents, staff and key players in the local and wider educational community, building professionalism and leading to better practice
- Establishing a culture of professional reflection, enquiry and learning within and across schools that increases teachers' aspirations and the development of better practice in teaching and pupils' learning
- Capturing the benefits more fully of within-school and across-school collaboration, in particular through peer learning, for challenging and developing the work of teachers and the learning of pupils
- Using school networks to develop capacity and ensure no school is isolated
- Focusing inspection to give greater support to professional accountability.

Building professional ownership of accountability

The key unit within any accountability framework remains the individual school. Each child and parent relates to the school and, indeed, to the teachers most concerned with that child's education. At this level, too, the teacher's moral and professional accountabilities are not only clear, but inextricably linked to and focused on real children and young people. A research study from the General Teaching Council (GTC, 2009) showed that teachers felt accountability most strongly in relation to their pupils. They felt particularly accountable for the quality of their own teaching and they acknowledged that maintaining public confidence in standards of teaching was an important part of this. Good leaders are able to build on these individual feelings of professional accountability so they become collective and an essential part of thinking and practice in the school. They build a culture so teachers feel accountable for all pupils in the school, not just those they teach.

At the beginning of 2012, I visited a number of first-tranche teaching schools in England (Gilbert, 2017). Each had been involved in system improvement for some time. All these schools:

- Expected teachers to be accountable for the quality of teaching and the impact it was having on the learning of individual pupils
- Were creating strong professional communities, where peer learning was central and focused on the detail of practice and pedagogy
- Used school-to-school collaboration to strengthen their review of practice and pedagogy
- Were engaging pupils in reviewing their own learning
- Targeted resources flexibly to meet both pupil and staff needs
- Were giving regular accounts to parents of their children's progress
- Gave regular reports to governing bodies about progress and performance at school level and, increasingly, about the progress and performance of the schools with which they were working.

The competition to become a teaching school in the first tranche had been considerable. These schools had all been judged outstanding by Ofsted; they had to demonstrate not only a strong tradition of professional development and learning but also of collaboration with other schools. This was therefore a skewed sample of schools but they had all embedded professional accountability. Many resented the pressure they felt from the public accountability framework but had the confidence and motivation not to be weighed down by it. Teachers talked with enthusiasm about working in schools with the best professional practices but they were also motivated by the impact of their work on children. It was a mark of their professionalism that they moved comfortably between formative and summative accountability; they saw the need for each, and several teachers described both approaches as "feeding each other." These schools had a confidence that is still too rare.

In their analysis of system leadership, Higham et al. (2009) point to the importance of strong internal accountability within schools, very similar to what I am describing as professional accountability. The authors looked at three schools in challenging circumstances where improvement had been sustained. Staff in these schools reported feeling very accountable. This sometimes stemmed from what they perceived to be managerial pressure but over time the pressure shifted to something more professional: "In particular, regular peer observation and collaborative planning helped to create a shared language about what was being found effective in engaging pupils in their learning" (Higham et al., 2009: 50).

In schools where professional accountability is embedded, teachers see themselves as responsible for the quality of their teaching and its impact on pupils' learning. They see learning from each other as routine. They welcome opportunities to engage pupils, peers and their own managers confidently and openly to generate greater intelligence, which they use to develop their knowledge and skills. They see such engagement as important not only in offering them practical insights into their work and pupils' learning but a good platform for developing better and sometimes innovative practice. This approach is central to their professional accountability and, in particular, their accountability for improving quality.

How can we find ways of enabling more schools to build strong, internal systems of professional accountability? How can we encourage them to ease their anxieties about a more vigorous approach to formative accountability and to help them see its potential as an aid to improvement as well as a support for test results and the outcomes of inspection?

Leadership for professional accountability

Leadership is the essential ingredient for change. It is leadership that establishes the vision, values, expectations, structures and processes for getting the work done. It is leadership which builds an internal, professional accountability system that is owned collectively. Whether they acknowledge it or not, all schools operate with various forms of accountability built into their day-to-day work. These stem from the leadership of the school and the culture that has developed—the expectations, behaviors and routines - as well as the different sense of responsibility and commitment that individuals bring. Accounting to whom, for what, and how therefore operates differently in different schools. The consequences of accounting are different too.

The four core domains of leadership practice identified through research (Leithwood et al., 2006) have stood the test of time (Leithwood et al., 2019):

- Building vision and setting clear directions
- Developing relationships and people

- Ensuring organizational design works in support of what's wanted
- Managing and giving active supporting to the teaching and learning program.

These are important but research also indicates that it is how these practices are enacted that remains crucial (Day et al., 2016, 2011). Leadership practice is what connects vision and policy to implementation and performance in schools.

Large scale statistical research (Louis et al., 2010) across several countries about effective school leaders found collective or shared leadership more powerful than individual leadership. The former is leadership that involves people at every level of the community in decision-making, whereas individual leadership is top-down leadership by the principal and a few senior leaders. The research concluded:

- Collective leadership has a stronger influence on student achievement than individual leadership
- Almost everyone in high-performing schools has greater influence on decisions than in low-performing schools
- Higher-performing schools award greater influence to teacher teams, parents and students
- Principals and district leaders have the most influence on decisions in all schools but they do not lose influence as others gain it
- School leaders have an impact on student achievement primarily through their influence on teachers' motivation and working conditions; their influence on teachers' knowledge and skills produces less impact on student achievement (2010: 19).

This sort of collective leadership has the potential for creating a culture where accountability is energizing and a force for improvement. It can create the conditions for individuals, teams and schools to own accountability and see it as an essential part of their work and development. They establish a culture of learning which feeds their internal accountability system to improve the quality of their teaching and their pupils' learning, enabling the school to work more effectively.

Based on research with a range of schools, Elmore (2004) also concluded that successful schools build a collaborative culture and internal accountability aligning individual responsibility and collective expectations. These in turn guided the motivation and actions of teachers. Staff share what I would describe as strong professional accountability. The schools in Elmore's research also performed well under the pressures of external accountability. Further research by Elmore (2008) confirms that schools with strong professional accountability seem to perform well on tests, regardless of whether their educational beliefs align with the tests.

Most research on leadership, for example in both the work of Elmore and Louis et al. cited above, emphasizes the importance of relationships and, linked to that, trust. Schools that have a strong moral purpose, captured in a collective vision and values, underpinned by a clearly articulated model for professional improvement have found it easier to establish a culture of openness and trust which makes people feel that change is possible. Trust is built on interactions and good relationships over time. If information-sharing, problem-solving and decision-making are genuinely collaborative, trust builds and improves the nature and quality of those relationships (Finnigan and Daly, 2012) so that individuals and schools are supported to learn better, take risks and innovate.

A good school accountability system must be able to identify and respond to specific problems in context. This can only work well if teachers feel safe to identify specific difficulties, to seek support and to innovate in a specific context. This includes permission to take risks and make mistakes, using these to learn. Greany and Earley (2017: 5) underline the importance of high trust in increasing leadership agency: "... where schools collaborate and share their expertise and capacity so that effective practice spreads, where leadership development and capacity building are prioritized and where leaders have a voice in shaping policy so they are committed to achieving shared goals ..."

Schools as centers of professional learning

School leaders who take collective professional accountability seriously know that it cannot be short term and is certainly not a quick fix. Culture takes time to develop and become embedded. A collaborative culture, which demands attention is paid to individual behavior, to teamwork and to organizational practices, needs to be supported by a focus on consistently building the school's capacity for learning. This requires organizational and resource investment, especially when it is rooted, as it should be, in a culture of practice analysis, professional development and peer learning.

The OECD (2016: 1) identified "seven action-oriented dimensions" as essential for what they describe as a model for the school as a learning organization:

- Developing and sharing a vision centered on the learning of all students
- Creating and supporting continuous learning opportunities for all staff
- Promoting team learning and collaboration among all staff
- Establishing a culture of inquiry, innovation and exploration
- Embedding systems for collecting and exchanging knowledge and learning
- Learning with and from the external environment and larger learning system
- Modeling and growing learning leadership.

Many successful school leaders operate this sort of model for learning. It can be used to help establish the conditions for an approach to accountability which energizes and supports staff. This requires an emphasis on locating the learning as close as possible to the internal work of the school, particularly in terms of practice relating to the detail of teaching and learning. This approach should include finding time for collective work on both individual and common problems. This builds professional and social capital. The negative connotations of the word mean that few leaders would use "accountability" to describe such

a learning environment. Placing “professional” in front of “accountability” gives back ownership of, and pride in, its moral purpose and professionalism.

Investment in learning is important. For example, time has to be found for teachers to work together, to observe, analyze, reflect on the detail of their teaching and pupils’ learning and then (which takes even longer) to shift deeply embedded practice through, for example, approaches such as instructional or incremental coaching. It is important that the focus is on visible evidence gained through observation of interactions, usually in the classroom. No single model of development guarantees success. Change needs to take account of organizational factors and specific contextual conditions of the school community (Gu et al., 2019).

Keeping learning as close as possible to the internal work of the school does not negate the need to look outwards. If the profession is to take greater ownership of accountability, evidence remains key. Collins and Coleman (2017) indicate evidence has become a feature of school system reforms over the last few decades. They argue persuasively that if its use is to become deeply embedded, it must be through an evidence-rich system and an approach focused on evidence for improvement. Professional accountability needs the sustenance gained through use of external research and evidence. It helps the school open its eyes as wide as possible, and as a consequence to learn and to thrive.

Developing collaborative and rigorous self-evaluation

The best schools know themselves well. This is the essential base for a professional and internal accountability system but also serves the demands of external accountability. The process of review and evaluation—at individual teacher level, at team level and whole school level—is fundamental to the way the school works. It is sensitive to the nuances of context and looks back as well as forward. With its focus on learners and learning, planned well, internal evaluation is an essential professional discipline. It can increase the sensitivity of teachers to the conditions for better practice, including the need for new knowledge and skills. It can serve the purposes of both internal and external accountability. As an extensive literature review on internal evaluation (Nelson et al., 2015) indicates, it is a powerful support for continuous improvement and professional development.

Data too, generated internally or from the public accountability framework, is important. This can raise questions, stimulate thinking and generate insights leading to action to improve practice. Data enables progress to be monitored. The role of quantitative data as a tool for school improvement is well rehearsed and widely accepted but data can emerge from a range of activities, principally observation, but also others, such as analysis of problems and case studies, or from interviews or focus groups. This sort of data is a strong support for professional accountability within and across schools.

The process of evaluation should operate at all levels within a school from interactions between teacher and pupil to whole school benchmarking. It may well be professionally led but it has to engage others. If moral accountability is to become more meaningful professionally, pupils, as well as their parents, have a key role to play in driving improvement and quality. They must have agency.

Pupils have a key role in evaluating the quality of support for learning and in helping to shape it too. Hattie (2009) undertook a synthesis of 134 meta-analyses of all possible influences on achievement. This showed clearly that pupil feedback was one of the most important influences. He captures the power of this approach in this description: “It was only when I discovered that feedback was most powerful when it is *from the student to the teacher* that I began to understand it better. When teachers seek, or at least are open to, feedback from students as to what students know, what they understand, where they make errors, where they have misconceptions, when they are not engaged—then teaching can be synchronized and powerful. Feedback to teachers helps make learning visible” (2009: 173).

As we saw during the pandemic, many schools have found new ways of interacting with parents about learning, including those who do not readily engage. There are examples where parents themselves have sometimes built their own virtual peer learning groups to support their children’s learning (Gilbert, 2021). There are signs too that schools’ increased confidence and skill in the use of technology post-pandemic is likely to lead to new and creative ways of engaging parents better.

The external accountability framework provides information for parents but test results, league tables and inspection reports give a narrow view about the school’s purposes. A global review (Cheng and Moses, 2016) considered 14 countries that used “school report cards” to inform the general public about school performance. No one model emerges from the review that would work for everyone but the concept of an annual school report card or record of achievement has the potential for providing parents and the local community with a broader and more balanced account of a school’s achievements. Indeed, the act of accounting could encourage an ethical, principled and professional stance by schools. For example, the school report card could recognize the achievements of pupils who do not often show up positively in tests or league tables or who arrive in school with a more challenging journey ahead of them, for example refugees. In giving an account of its work, the school would need to capture the voices of children, parents and employees. This sort of report to parents and community could prove a valuable part of the school’s professional accountability system.

At whole school level, self-evaluation is also a tool to help redress the balance between summative and formative accountabilitys. If it is to strengthen the professionalism of teachers, it has to be undertaken as a collaborative exercise including collective decision making. Evaluation should flow from the school’s vision and values, capturing its moral and professional accountabilitys, but also its contractual and market responsibilities. Good leaders establish a culture of supportive review, of disciplined enquiry leading to professional learning and action for improvement. This is what sustains formative accountability and, ultimately, produces good outcomes to evidence quality.

Increasingly, good leaders know that if this culture is to be driven by the best knowledge and understanding, lateral interaction beyond the school is vital. They are keen to seek professional excellence by extending knowledge and thinking to improve practice. This resonates with Mourshed et al. (2010: 81) who report leaders' identification of three key professional changes brought about by collaborative practice:

- Teaching practice is made public and the entire teaching profession shares responsibility for student learning
- There is a cultural shift from an emphasis on what teachers teach to what students learn
- A normative model of pedagogy develops, with teachers the custodians of that model, much as "doctors, lawyers and accountants establish norms of good practice and hold each other accountable for following them"

The use of professionals beyond the school to strengthen self-evaluation supports collaborative practice and, if followed through with sufficient rigor, could support the purposes of both internal and external accountability. Indeed, it has the potential for significant change in the way many external inspection systems currently work.

As Matthews and Ehren (2021) reference, there is evidence that both self-evaluation and peer evaluation provide powerful support for improvement as well as for meeting the demands of any external accountability system. The assumption is that reviewers will bring a trusted and fresh professional perspective, rooted in school-based evidence, that stimulates, challenges and supports. One of the uses of peer evaluation is as a means of validating self-evaluation.

Collins and Coleman (2017: 17) argue that incorporating evidence as central to decision-making will have a significant impact on pupil outcomes. They define evidence as "knowledge generated by external research that is transparent and rigorous." This has considerable value but I would go further and argue that a disciplined and collaborative approach to school evaluation, particularly involving colleagues external to the school, yields good evidence for decision-making and builds professional accountability.

Given the more recent growth of peer evaluation, there is less extensive research about its impact than there is about self-evaluation. The research that has taken place indicates that the process can lead to powerful professional development and mutual benefits for reviewers and their schools (Matthews and Headon, 2015; Matthews and Ehren, 2021). At its best, peer evaluation is formative lateral accountability in action and has the potential for enriching professional accountability.

In England, the use of various forms of peer review has been growing for several years with one study showing that 48% of school leaders reported that their school had been engaged in peer review in 2017 (Greany and Higham, 2018). It has emerged more slowly in other countries but peer review practices have been identified in Belgium, the Czech Republic, Finland and Sweden (OECD, 2013). Godfrey's study of peer review (2020) describes further instances of peer review in Australia, Bulgaria and Chile.

Godfrey's extensive analyses of different models characterizes peer review as either formative ("subjectivist") or summative ("objectivist"). He argues that the latter is more common and is sometimes used to prepare schools for an inspection. Nevertheless, he sees potential in further research and development of the model of peer review. Subjectivist models, he argues, focus more on deepening and sharing knowledge and learning about practice. Certainly, a model of collaborative enquiry, Research-informed Peer Review (RIPR), which Godfrey (2021) describes, has considerable potential for strengthening professional accountability through collaboration between leaders from schools and academic researchers. In RIPR, leaders and researchers identify a shared enquiry theme, which has impact on student outcomes. Working in clusters, they review the academic literature and evidence, then work through a cycle of iterative school review visits supported by workshops to develop practice. This approach is similar to action research and participatory evaluation.

Locality partnerships as support for professional accountability

In England, the growth of locality or place-based partnerships over recent years represents a response to the challenges resulting from an increase in the number of autonomous schools and the reduced power of local authorities to ensure a fair and coherent local education system (Gilbert, 2021). This situation is not unique to England; in many other countries, districts or local authorities have lost the power to coordinate local school systems.

Schools choose to join these partnerships because they share an overriding commitment to place and community. They see the partnership as a way beyond their school of helping them bring about the difference they want to make to the lives of children and young people.

In most instances, local authorities, who would previously have held considerable responsibilities for school performance and improvement, have driven the establishment of these partnerships. They are using them as engines of professional development, particularly to address local issues of quality and equity, which cannot easily be tackled by autonomous schools working alone. They commission a range of improvement services from the partnerships. This foundation of democratic and local accountability stemming from the role of the local authority but blended with the professional and moral accountabilities of schools, underpins the development of place-based partnerships. It gives powerful legitimacy to their work. It also gives them a strong platform to support the development of professional accountability within and across schools.

All partnerships have a strong focus on how professional learning can be shared or developed across schools. They have brokered and organized activities such as school-to-school support, peer review, teacher networks reflecting different communities of professional interest, practice improvement work, continuing professional development and action research. For many partnerships, this work involves using practitioners from schools as key source of expertise and creativity. By being involved in these sorts of initiatives, leaders and teachers start to feel professional and moral accountability for the children beyond their own schools.

Teachers in many areas have spoken with enthusiasm about the opportunities afforded by co-designing improvement initiatives created by their partnerships (Gilbert, 2017). They enjoy the creativity of working collaboratively to establish better or even innovative practice and they are developing their own knowledge and skills. When teachers work together to develop practice, not only are they benefiting professionally, they are also beginning to feel pride in the system by contributing to the greater good (Fullan and Boyle, 2014: 121). It is this sort of collaboration that is likely to build individual and collective capacity to sustain professional accountability.

At their best, place-based partnerships in England provide leadership for the strategic oversight of education in their area. They are bringing autonomous schools together, moving knowledge and learning around the system, increasing coherence and reducing the risks of fragmentation and isolation. Schools themselves take responsibility for their own collective performance, supporting each other and helping to improve outcomes for children and young people. This is lateral shared accountability, embedded in collective moral purpose and professional networks. Partnerships can help strengthen a model of accountability, professionally owned by teachers and schools. This can motivate, inspire teachers and incentivize system-wide collaboration to improve learning, thereby building greater professional capital and strengthening accountability.

Inspection as support for professional accountability

Governments need public accountability systems that ensure public money is being well spent on high quality education. Generally, they would expect systems to identify strengths as well as the improvements needed. Greater emphasis on schools developing more inclusive and rigorous professional accountability systems could support both internal and external accountability better. Inspection has a key role in accounting to government and the public about the quality of education but it could also have a stronger part to play in supporting schools to develop their approach to professional accountability. This would be particularly important in systems, such as England, which continue to operate systems of high stakes accountability.

Ehren (2019) argues for using inspection to help schools develop a culture of professional learning, within which schools are supported to become more enquiring and research informed. She presents a radically different model of inspection in which, “evaluation criteria are designed around how schools engage in research and use research evidence to inform their practice” (2019: 52) rather than a reliance on an inspection framework. Evaluations would be grounded in the needs of the school and its stakeholders. Certainly, this alternative model has considerable potential for supporting all aspects of school evaluation and professional accountability.

In England, if Ofsted were to take a different approach to the inspection of those schools that had undertaken a strong self-evaluation process, as described earlier, change would be dramatic. Ofsted might test the rigor of the school’s annual, summative self-evaluation and the professional accountability processes underpinning it. If inspectors found these to be strong, they would give formal and public endorsement of the school’s judgments and evaluation of itself. However, in undertaking scrutiny of the self-evaluation, if inspectors had concerns about judgments or process, they would extend their time in the school to carry out a full inspection and produce a full inspection report. For the best schools in the system, those with strong professional accountability embedded in their work, Ofsted would therefore be adopting a transparent, more cost-effective, quality assurance role which would not necessarily entail inspection.

At the same time, this process would enable Ofsted to identify samples of schools that might be usefully selected for in-depth studies of particular issues or aspects of education of interest to the government or indeed, the public. Examples of such studies might include current issues such as the impact of Covid-19 on children’s learning or the use of Artificial Intelligence for student learning in schools. In-depth reports of this nature have the potential not only to strengthen learning in schools by sharing professional capital across the system but also to inform government about where investment is needed in the system.

The British Educational Research Association (Moss et al., 2021) proposed reform of England’s high stakes accountability system that would also improve the quality of pupils’ and teachers’ experiences. Having surveyed other countries use of national sampling, their report points to the success of the National Education Panels (NEPs) in Germany. Data and research are used together to inform federal policy and practice. Moss et al. suggest replacing tests and school league tables with a nationally representative sample of pupils who would be tested over time on a broad range of skills and competences. The system would also involve gathering a range of in-depth, contextual information on schools and their communities using school, parent and pupil surveys. This combination of data could then be used to inform investment and other aspects of system improvement. Summary reports based on the national sample would be accessible to the public. Schools would be able to use the national data provided by the sample to support their self-evaluation as well as learning more widely from the summary reports. The report proposes too that inspection processes should be redesigned to support schools’ use of the research evidence and also peer learning. If enacted, all these proposals would have considerable potential for strengthening professional accountability.

Conclusion

The impact of external accountability practices on both equity and educational quality is hard to establish. Greater focus on using it to support both is crucial. This requires policymakers to design national accountability policy and practices that not only provide transparent information about education but also steer and support schools in their work. External accountability should be judged on how well it supports and improves schools’ systems for professional accountability as well as the quality and impact of its

information to government and the public. This would foster an emphasis on encouraging self-improvement and help build the professional capital of leaders and teachers across the system. The public accountability system could continue to prove quality but give greater support to improving it too.

However, real change will only occur when accountability has been reclaimed by schools and is seen as absolutely central to their work and teachers' professionalism. This means leaders and teachers taking pride in their role as agents of professional accountability and working collaboratively within and across schools to strengthen it. This culture of collective responsibility, trust and high expectations for performance and learning, underpinned by shared values and practices, has the potential for transforming systems. A strong approach to professional accountability within and across schools should feed effortlessly—and without as much pressure as evidenced currently—into public accountability frameworks. Indeed, the two approaches should become mutually reinforcing thereby strengthening learning, development and performance in all parts of the system.

Introduction

This article explores what principals do using the lens of *work*. It not only considers what principals do but also why this work is changing, and the consequences of this changing work on principals themselves, such as the impact of work intensification. Scholars in educational administration and leadership have explored what principals do using several lenses: (a) role, (b) time on task, and (c) work. This article is organized into several sections. The first section presents some of the existing literature on the aforementioned lenses. The second section discusses what is known about principals' work, including (a) what they do and (b) the changing nature of their work in contemporary times. The third section discusses why knowing about principals' work is important.

Role

Getzels and Guba (1957) were the first scholars to prominently consider the concept of *role* in organizational systems. Since then, scholars have employed the concept of role in a number of ways (e.g., Goodwin et al., 2003; Hadjiithoma-Garstka, 2011; Mitchell and Sackney, 2006; Whitaker, 2003). The problem with these studies, however, is that many of them tend to focus on a particular policy/issue or approach role through a narrow lens rather than recognizing that principals have multiple roles. A more serious shortcoming of using role to understand what principals do is that it is "unrealistic to assume, as most role theorists do, that the position that a person occupies will dictate what he or she does" (Ryan, 2007, p. 344). Examining what principals do solely through the lens of role erroneously assumes that principals exclusively engage in the actions associated with their assigned roles. Doing so fails to acknowledge that the work of principals may fall outside of their official roles, be shared with others, or be influenced by the unique contexts in which they work.

Time on tasks

Another lens explores what principals do using the concept of time spent on tasks. Time-on-task studies have existed over several decades (Lee, 2021). Although the majority of these studies avoid the issues of the role lens, they nevertheless have their own shortcomings. Perhaps the most cited shortcoming for some of the seminal studies is the lack of attention given in time-on-task studies to the nature of the task itself (Gronn, 1982). Specifically, time-on-tasks studies in the past have generally failed to interrogate the meaning of the tasks or why administrators are engaged in them. For example, although they may meticulously document the frequency and duration of telephone conversations, few inquired into the nature of the conversations (e.g., negotiating with a school board employee, talking with a parent, seeking advice from a colleague, etc.). Other efforts have been made to try to interrogate the meaning of tasks and why administrators engage in them; methodological approaches have included the use of structured observations and reflective interviews (Martinko and Gardner, 1990; Pollock and Hauseman, 2016) as well as self-report activity logs (Goldring et al., 2008; May and Supovitz, 2011). However, these methodological approaches have limitations as well. Rowan (2021) presents a list of assumptions that exist with this research, from conceptual, to scale construction, to generalizability. Lastly, there is an effort to move away from the use of clock time to help determine what principals do and why to consider a different theoretical approach instead, where rather than use clock time as the unit of analysis, to flip this notion on its head and analyze what it is that principals actually do in their work regardless of how much time it takes for the task to be completed (Eacott, 2018).

Work

The notion of work used in this article acknowledges the wide-ranging, diverse, and complex nature of what principals do. Work is defined as labor or effort expended to achieve a particular set of goals (Merriam Webster, n.d.). Work can be both paid and unpaid. It includes employment-related unpaid work but not other kinds of unpaid work such as volunteerism, household activities, or family responsibilities (Drago, 2007). This labor may be expended both within *and outside* position-related roles that principals enact. It is difficult in this day and age to erect clear boundaries around work efforts, just as it is to define organizational boundaries (Ryan, 1996). Work can take place on and off the school site. It can occur after the official opening and closing of the school day. Work also comprises particular experiential components such as physical, mental, and emotional aspects (Applebaum, 1992; Gamst, 1995). This article employs a lens that acknowledges the behavioral, cognitive, *and* emotional elements of work. In some existing research, the term workload is used interchangeably with *work* (See Oplatka, 2017).

What do we know about principals' work?

Interest in principals' work has existed for centuries (Ensign, 1923; Pierce, 1934; Rousmaniere, 2013). Scholars interested in this area have focused on topics such as:

- the growth of school systems in the 18th and 19th centuries and beyond (Kafka, 2009),
- the duties of principals (Davis, 1921; Bolton and Howard, 1925),
- the professionalization of school leadership (UNESCO, 2016),
- the roles of the principalship including the ongoing debate around leadership and management (Spillane, 2009),
- school improvement (Harris et al., 2013),
- recruitment and retention (Dite, 2020; Jackson, 2018),
- leadership frameworks (Gümüç et al., 2018; Leithwood et al., 2017),
- accountability (Andreyko, 2010),
- job satisfaction and motivation (Wang et al., 2018a,b),
- work and labor such as workload (Oplatka, 2017),
- intensification of work (Riley, 2014, 2019; Walker, 2021), and
- wellness (Richardson, 2020; Riley, 2019; Wang et al., 2018a,b).

Historically, time use studies have divided principals' work into four dimensions: (a) leadership, management, and administration; (b) external relations; (c) internal relations, and (d) principals' own professional development (Lee, 2021). However, these categories are not necessarily discrete, as managing both internal and external relations often falls under the umbrella of leading and managing, for example. Given that it is impossible to comprehensively cover all four dimensions within a single article, I collapsed these four dimensions into two foci: (a) what contemporary principals' work entails, and (b) the changing nature of their work. These foci were selected because they provided a way to structure a manageable overview of the work that principals do across these four categories and how this work influences their wellness.

Leading curriculum

There are numerous purposes of K–12 education (Gutek, 2014). Regardless of which purposes are espoused, they all include the co-creation of understanding, knowledge, and skills with children who attend these K–12 education systems. Depending on the

geographical context, school principals are referred to as educational/educative leaders (Duignan and MacPherson, 1992) leaders of instruction (Hallinger, 2005), curriculum leaders (Glatthorn et al., 2018), pedagogical leaders (Macneil et al., 2005), leaders of learning (Hallinger, 2011), and leaders of student learning (Robinson, 2011). Their overall work is to lead, support, and facilitate at their work site (Pollock and Hauseman, 2015).

Managing the budget

Schools have always had budgets and leaders of schools have always had some kind of interaction with these budgets, from merely knowing what the fiscal amount is and where the funds are going to site-based management with full discretion on how to spend the annual budget (Pollock and Hauseman, 2015). However, it appears that with the onset of reform efforts and school improvement initiatives, “budgeting” has become more complex than previously experienced. In 2013, the Organisation for Economic Co-operation and Development (OECD) Teaching and Learning International Survey (TALIS) report ranked “inadequate school budget and resources” as the top barrier to principal effectiveness; in Alberta, Canada it was ranked second (OECD, 2013). This lack of financial resources is becoming a global reality (Caribbean Policy Research Institute [CaPRI], 2014; DeAngelis et al., 2018; Lupton and Thrupp, 2013; Mahoney, 2013; Martin et al., 2018; Semuels, 2016; OECD, 2012, 2017; World Bank, 2019; Zimmer, 2020). It is not only the lack of resources that is changing but also the demand to find creative ways to either secure these resources (OECD, 2017; Walker, 2021) or manage with less. In Ontario, a recent study indicated that nearly one-third of the 70 principals interviewed required additional professional learning to manage the school’s budget or deal with other financial aspects of the position (Pollock et al., 2015). There is also growing interest in the work of fundraising for school principals and budgetary allocation (Poole and Fallon, 2015; Winton and Milani, 2017; Walker, 2021). For example, concerns around budgetary allocation have also heightened during the COVID-19 pandemic as educational policymakers and leaders face budgetary cuts (Al-Samarrai et al., 2020; Mitra, 2020) at a time when additional costs are incurred to not only keep students safe but also to address growing inequities (Allen et al., 2020; Daniela et al., 2021; Friedman et al., 2021; Sider, 2020).

Dealing with personnel

Managing personnel has always been a component of principals’ work (Norton, 2008). Whom they manage and for what purposes also slightly vary depending on the organizational structure of the public schooling. For example, some school principals who work in schools that engage in site-based management have more decision-making power about who works at that site (Patrinios and Fasih, 2009; Rose, 2007; Whitaker, 2003; White, 1989; Wohlstetter and Mohrman, 1993), whereas school principals who find themselves in school systems that are very bureaucratic and centralized have limited control over hiring practices (Hanson, 1976; Maynes and Hatt, 2015; Oplatka, 2004; UNESCO, 2016). Some argue that managing personnel and leading teachers cannot be separated; although they are closely connected, the focus here is on the technical aspect of working with people that requires principals to be knowledgeable about labor contracts and possess skills such as conflict resolution, the ability to supervise multiple employee groups, and to address grievances (Castro, 2020; Engel and Curran, 2016; Matubatuba, 2008; Sorenson and Goldsmith, 2008).

Maintaining the school site

Principals are responsible for maintaining school sites. It is, however, not an easy task. It can also take on many forms. In some jurisdictions, principals with limited financial freedom are only responsible for reporting building issues and providing information about buildings when asked by their system managers. Although this might seem to be a simple reporting procedure, the work can contribute to the growing paperwork and procedural work that school principals find themselves doing. Other principals with more decision-making power working in older schools are faced with difficult decisions about allocating resources; they must self-educate on what needs to be prioritized, and must oversee any renovations and/or repairs (Díaz-Vicario and Sallán, 2020; Federal Emergency Management Agency, 2017; Nhalpo, 2020; Preiss, 2014). However, it is not just older buildings that require principals’ time and attention—new school development projects can be just as taxing on a school principal’s time. New school buildings require an effective maintenance plan that includes meeting warranty deadlines and constant revisiting as the building ages (Chan, 2000). And yet, in decentralized schools in some regions, principals may find themselves literally having to source supplies, purchase them, and in some cases actually engage in the skilled labor work themselves. For example, in Jamaica, some school principals actually fundraise, purchase the lumber for additions, and then build the additions themselves (Walker, 2021). In more recent times, school principals now have the added layer of having to create safe learning and teaching spaces during the pandemic, where expectations of social distancing influence class size, structure of the school day, and so forth (World Health Organization, 2020).

Building and sustaining partnerships

Principals are often engaged in partnerships. In this article, a partnership is understood as a relationship with an outside organization or group (as opposed to relationships with individual parents or families). Many advocate that partnerships can be a way to support student achievement (Hands, 2010), and can be considered a part of instructional leadership. However, I have separated this category from instructional leadership as it does not facilitate principals’ direct involvement in curriculum instruction in their

daily work. Schools are being encouraged to engage in outside partnerships for all sorts of reasons: to generate revenue, such as by renting out building space after school hours (Clandfield, 2010); to foster closer connections to services that the school cannot effectively provide, such as supplemental educational services (Koyama, 2011); or as a way of engaging ethnic, racial, and religious communities with the school and with student learning (Auerbach, 2010; Rogers et al., 2012). Effective partnerships require trusting relationships, a central purpose, and leadership to name but a few components (Best and Holmes, 2010). For many principals, engaging in partnerships at the school level requires engaging in partnership-building and maintenance tasks that can at times take them away from direct school functions. Notably, during the COVID-19 pandemic there have been calls for schools and school systems to work more closely with outside agencies, especially those in public health as concerns over student mental health and wellness have increased (Hertz and Barrios, 2021).

Processing paperwork and forms

Paperwork has always been a part of principals' work (Georgiades and Jones, 1989; Wang et al., 2018a,b; Williams, 1979). Before the recent advances in information communication technology (ICT), paperwork would have arrived on a principal's desk through the general post or through intercourier district mail bags dropped off at specific times at the school site, then eventually through fax correspondence in the office; now, principals are likely filling out PDF forms received via email either by smartphone, tablet, or laptop or through an interactive web platform where they electronically respond to requests and provide information to those requesting it. Paperwork can be understood as the medium for accountability mechanisms that principals are required to respond to on a daily basis. The majority of paperwork that contemporary principals respond to is generated from the accountability mechanisms entrenched in jurisdictional policies that they are to follow (Fitzgerald, 2009).

Changing nature of principals' work

Principals' work is always changing and both researchers and practitioners have documented these changes over the centuries (Alvoid and Black, 2014; Bredeson, 1989; Darling-Hammond et al., 2007; Day et al., 2000; Hallinger, 1992; Huber, 2004; Klein and Ninio, 2019; Pollock et al., 2015). The nature of principals' work continues to evolve in response to local and global contexts. Long before the COVID-19 pandemic, principals were responding to several global changes. A few are reported here, such as working with new advances in ICT; evolving understandings of equity, diversity, inclusion, and decolonization; program, policies and accountability initiatives; student wellness; and COVID-19 and occupational health and safety guidelines.

Advances in information communication technology and social media

Because school principals spend a considerable amount of time communicating, they have always capitalized on the various modes of communication available to them beyond face-to-face interaction. In the past, this could have involved writing handwritten letters, making telephone calls, and sending faxes. With advances in ICT and now social media, principals are faced with an entire new suite of communication media. The Internet, email, texting, smartphones/mobile technology, and social media platforms and programs have profoundly impacted the work environments of a number of professions. The education sector, specifically the school principalship, has been and continues to be highly affected (Anderson and Dexter, 2005; Cho, 2016; Cho and Jimerson, 2017; Davies, 2010; Fancera, 2020; Fullan, 2014; Liu et al., 2018; Omar and Ismail, 2020; Pollock and Hauseman, 2018; Sheninger, 2014; Uğur and Koç, 2019). Many scholars have purported that technology makes work easier, increases efficiency, reduces paperwork, and promotes work-life balance (Fullan, 2014; Sheninger, 2014). My own research has indicated that the use of email can lead to fast and efficient communication with various stakeholders, assist school principals in managing their workload by allowing them to complete tasks faster, while emails leave an accountability trail through recording communication and an accurate trail of tasks and activities (Pollock and Hauseman, 2018). But there is also a flipside to the use of ICT as well. Emerging evidence has demonstrated that how school principals manage the changes resulting from increased use of email in the workplace is not uniformly positive. Principals also report high volumes of email, longer workdays, increased workload, increased expectations of shorter response times, and the blurring of boundaries between work and home—all of which contribute to the intensification of work (Pollock and Hauseman, 2018).

Equity, diversity, inclusion and decolonization (EDID)

Systemic inequity exists globally. These inequities—for example, social, racial, religious, socioeconomic, gender-based—prevent some groups of students from receiving the same quality education as students from other groups. Over time there has been a growing movement to reach and support *all* groups of students. Although not universal, most democratic countries are striving for this goal through policy changes and program modifications (OECD, 2020, 2012; UNESCO, 2015), embracing diversity with the populations they serve and the workforces they employ (Hewins-Maroney and Williams, 2013; Pollock and Briscoe, 2019), engaging in inclusive and equitable practices (DeMatthews et al., 2021; Gümüş et al., 2021; Ryan, 2014), and working

toward decolonizing the systems they work within (Hohepa, 2013; Munroe et al., 2013; Stewart and Warn, 2017). Efforts to enact EDID often require school principals to challenge their own biases, change their mindsets around their assumptions and beliefs, and engage in their work in a different manner.

Policies, programs and accountability initiatives

Principals' work is influenced by policies. Reform movements and accountability initiatives have used policies as tools to initiate and support educational change. For this article, policy is understood as a way to change practice through official formal legislation, mandates, government initiatives, and board regulations. Policies can act to promote, regulate, constrain, and/or monitor actions and outcomes. Recent studies in Canada indicate that policies are playing a more significant role in principals' work than in the past. Many school principals feel that their role is constrained by the number of initiatives imposed on a school (Alberta Teachers' Association and Canadian Association of Principals, 2014; Blakesley, 2012). Not only do principals in Ontario feel constrained by formal policy initiatives, but multiple policy initiatives within short time periods have also influenced how they do their work (Pinto, 2015; Wang et al., 2018a,b). The OECD Teaching and Learning International Survey (TALIS) report ranked "government regulation and policy" as third on its list of barriers to principal effectiveness (OECD, 2013).

Student wellness

Principals spend time promoting student wellness. In North America, student wellness has become a focus in public education. Some practitioners have indicated that they deal with increasing incidences of issues relating to the mental health and well-being of students and staff (Pollock, 2016). There appears to be no consensus on why these incidents are increasing (Olson et al., 2015; Whitaker, 2010). Some argue that the number of incidences is not increasing, but rather it is awareness of mental health issues that has increased (Whitaker, 2010). Principals are not ignoring the health and well-being of students and teachers. For this reason, they often find themselves seeking out additional community services and resources for students and families, engaging in informal counseling and information-sharing sessions, and providing support for teacher professional learning—activities in which they would not have been involved in the past.

COVID-19 pandemic and occupational health and safety guidelines

Principals play a pivotal role in creating a healthy school community. This work has been especially critical during the COVID-19 pandemic. Principals are legally responsible for this through various labor laws, public health laws, and education laws. Many of these responsibilities are connected to employee and public safety through labor laws or through public health and education legislation that focuses on students' well-being, health, and safety. These responsibilities and tasks have always existed and vary between jurisdictions but generally include being legally responsible for the health and safety of all students within the school. For example, in some jurisdictions principals are required to implement school-wide antibullying or antiviolen policies and plans. Other jurisdictions expect principals to connect with representatives from other government agencies such as public health in an effort to better meet student needs or provide student support services. Some principals are also explicitly expected to report any child welfare concerns to their superintendent and appropriate government officials (Pollock and Hauseman, 2015). Last but not least, principals have been charged with the responsibility to notify the appropriate authorities of any outbreaks of infectious or contagious diseases. It is precisely this last responsibility that has recently influenced the nature of public school principals' lives. Because of the pandemic, educators, including school principals, have been subjected to drastic changes in how public education has been delivered. All jurisdictions around the world have been impacted by the pandemic. The majority of school systems have engaged in a series of practices from full school system shutdown to full online learning to various hybrid versions of learning (Netolicky, 2020; Pont, 2020).

Work intensification

It is one thing to document the ever-changing nature of principals' work; it is another to also explore the influence of these changes on school principals. Some researchers explore the impact of student performance and system success, others consider the impact on the health and wellness of individuals in the school principal role and yet others consider the labor impact of school principals. The intensification of work can be found in several work sectors such as engineering, nursing, and medicine (Brannon, 1994; Willis et al., 2015; Wong et al., 2019). Principals also experience work intensification (Alberta Teachers' Association and Canadian Principals Association, 2014; Armstrong, 2015; Leithwood and Azah, 2014). The remainder of the article argues that the changing nature of principals' work is leading to work intensification.

Working long hours

Principals work long hours. There is a global trend of long work hours culture (Chatzitheochari and Arber, 2009; Kodz et al., 1998; Pencavel, 2018; Waheed, 2010). Principal workforces are no different. Time-on-task studies provide various quotes on hours worked per week. For example, in 2019, in a regular work week in Ontario, principals worked an average of 57.3 h. Almost all participating principals (97.5%) worked more than the normal 40 h work week; almost half of the participants reported

(47.3%) working between 50 and 60 h per week. In addition, 21.4% worked more than 60 h per week. This is approximately 16 h per week more than Canadian occupational managers (Statistics Canada, 2020) who work 40.9 h per week. The trend toward long work hours is not isolated to Canada, however. In Australia, it appears that school principals spend on average 51–60 h per week during regular school time (Riley et al., 2020). It would be a statistical feat to compare these time-on-task studies as not all studies are exact replicas of each other (Rowan, 2021). However, cumulative statistical findings and qualitative studies indicate that most school principals around the world work long hours. Although working long hours can reap benefits and/or pose disadvantages, most employed people experience periods of long work hours. Working long hours may be considered part of intense work situations, but by itself it does not constitute work intensification, especially given that we do not know whether principals have always worked these long hours. However, working long hours can be an intermediary factor that, combined with other factors, can lead to work intensification.

Increased volume of similar work

Work volume is often referred to as the amount of work or number of tasks that an employee is to do within a specified period of time. Recent studies have discovered that school principals are reporting an increased volume of similar work. Specifically, they describe doing more of the same types of work. One example is paperwork. The principalship has always required some amount of paperwork; over the past decade, principals have reported engaging in increased amounts of paperwork (Alberta Teachers' Association and Canadian Principals Association, 2014; Hancock et al., 2019). An increase in work volume means more work, which may not pose issues for employees if they are allowed to delegate other work tasks or are able to work additional hours until the additional work is completed. However, in most situations, the volume increases without any ability for principals to delegate other work and the expected time to complete this additional work has not changed but remained the same. For those in the principalship who experience work intensification, they work longer hours to attend to both an increased volume of work and to additional different kinds of work.

Engaging in new work demands

As mentioned previously, the work of principals is dictated by the local context and global trends. In many cases, this means that how they go about their work has changed. For example, principals have always been responsible for communicating with parents. How they go about doing that today has changed. In the past, principals may have met parents in face-to-face meetings; they most likely still do meet face-to-face, but they also communicate through paper notices, electronic newsletter, and by email. The end goal is the same but the mode and medium are quite different. In some cases, this also means that the very nature of their work has changed. Over the past decade, many countries have experienced a concentration on student mental health and wellness. As mentioned earlier, there has been a shift in supporting student mental health and wellness. This concern has also extended to teacher mental health and wellness, especially given that there is increasing evidence that teacher wellness may influence student wellness and school success (Harding et al., 2019). This means that principals are engaged in additional support-seeking for not just student wellness but also teacher wellness, something that in the past was not always a consideration. Moreover, since 2020, the COVID-19 pandemic has seen yet again additional work for school principals such as extending the notion of care to preventing school breakouts, containing breakouts, working toward continued student learning through physical school closures and multiple modes of curriculum delivery, and concentrating on being a technology leader (Osmond-Johnson et al., 2020; Pollock, 2020).

New work demands do not directly lead to work intensification. In many organizations, when an employee or team is provided with new tasks, other work is reassigned, put on pause, or additional staff are hired; however, in the public education system, this is not the case. School principals often find themselves continuing to juggle the increased work that they already have with the new expectations and tasks assigned to them while little is removed from their workload. Many principals are also finding that the pace of their work has also increased.

Increased pace of work

Principals must deal with an increased pace of work. This pace of work is sometimes determined by policies and procedures that stimulate timelines and deadlines; other times it is because of bureaucratic decisions made elsewhere. Principals may not experience work intensification through working long hours with additional work and new tasks if the expectations for completion are flexible and there can be extensions. In reality, however, not only is the time of return less flexible, principals have indicated over the past decade that the expectation for completion or responses to requests has shortened, which increases the pace of their work. The increased pace of work coupled with increased work and additional roles can result in principals finding their work challenging at times. Working in these conditions when there is constant pressure over perceived or limited resources contributes to work intensification.

Perceived limited resources

In some jurisdictions, there are limited resources and financing for public schools to successfully function (Walker, 2021); in other jurisdictions, there may be plenty of funding for public schooling but that funding might be ear-marked for specific initiatives and can only be spent in particular ways (Pollock et al., 2015). This is an issue for principals and can contribute to work intensification. For example, in other sectors, departments and organizations often have control over their budget and can hire more staff or professionals to share work volume and additional tasks to meet the quicker turn-around times. In public education, some principals may

be fortunate enough to reassign some of their work to other administrative staff such as the vice-principal and/or other administrative assistants but in some cases this then creates other consequences such as the downloading of work to vice-principals or assistant principals (Leithwood and Azah, 2014; Lim and Pollock, 2019; Pollock et al., 2017; Swain, 2021). In some site-based management arrangements, a principal may be able to hire additional administrative support but these situations are uncommon. Many principals not only have little control over their budget in terms of hiring staff but many also have found themselves with less administrative and staff support over the past few decades (Beusaert et al., 2016; Friedman, 2002). Limited resources alone does not mean work intensification; however, being asked to do more under increased pressure and pace with less increases the chances that a school principal will experience work intensification. The key however is whether principals working in this environment have the opportunity for any downtime.

No downtime

Principals have little downtime. Of all the key components of work intensification, downtime is the most influential. The notion of downtime was originally used in relation to innate networks and machinery systems in production plants during the mid-1900s. When a piece of machinery was out of service, either planned or unplanned, the production process was experiencing downtime (Online Etymology Dictionary n.d.). The use of the concept was not applied to social and production practices of individuals until the early 1980s; in these cases, downtime was an employee's time away from paid work or for individuals it can mean time away from paid work where the employee experiences a state of physical relaxation and psychological detachment from paid work (Dugan and Barnes-Farrell, 2017).

People who work in fast-paced environments with incredible amounts of work to be accomplished within a short time frame by working long hours with limited resources or work accommodations may experience work intensification; however, if these intense periods of work are followed by periods where employees or workers are rewarded with additional time off and/or the work environment converts to a slower pace with reduced workload expectations and reduced hours of work, then these employees are not necessarily experiencing work intensification. Work patterns where employees can recharge, regroup, and recover from the intense work are not experiencing work intensification. They may have experienced a period of intensified work but work intensification is the ongoing intense work environment that has no downtime. Downtime, or more accurately, little to no downtime, is usually the deciding factor on whether or not a workplace is experiencing work intensification. No downtime usually leads to all sorts of unintended consequences such as lost days of work for the employer, burnout, and other occupational wellness issues for the employee (Giurge et al., 2020; Lei et al., 2019; Shattell, 2018).

Some skeptics of work intensification in the public education workforce argue that educators and principals receive downtime on weekends, statutory holidays, and school system summer holidays. Although structurally this can appear to be the case, emerging time-on-task data and qualitative studies indicate that these scheduled downtimes are in reality the times during which many principals work additional hours to catch up on unfinished work or work that demands uninterrupted concentration on specific tasks. A recent Australian study, for example, reported school principals spend 25–30 h working per week during holiday periods (Riley et al., 2020). In many jurisdictions, school principals are responsible for continued professional learning, yet this expected learning is rarely scheduled in a principal's work day and therefore is fulfilled during time periods that would be considered downtime.

Why this is important to know

Work intensification, if left unchecked, can lead to all sorts of consequences for those individuals experiencing it. Work intensification places greater demand on workers' cognitive, psychological, and physical abilities (Fournier et al., 2011); it is associated with numerous psychological hazards such as "chronic stress, anxiety, depression, psychosomatic disorders, psychological decompensation mechanisms, work addiction (workaholism) and burnout" (Legault and Belarbi-Basbous, 2006, p. 26). A 2010 report by the World Health Organization highlighted these types of psychosocial hazards as an emerging trend in occupational health and safety: "Work overload would appear to constitute one of the main psychosocial risk factors leading to psychological distress at work" (Fournier et al., 2011, p. 4). Some of the consequences of work intensification include poor employee performance, increased job stress, low morale, burnout, poor occupational mental health and wellness, negative repercussions for leisure, and personal and familial issues (Burchielli et al., 2006; Caudroit et al., 2011; Canadian Center for Occupational Health and Safety [CCOHS], 2012).

Principals in public education appear to be exhibiting signs of unwellness. Concerns regarding stress, burnout, coping strategies, workload, and the general health and wellness of school principals and administrators have proliferated since the 1970s. According to Poirel et al. (2012), between 1966 and 1988, more than 1300 articles were published concerning principals and stress. Many of these studies point directly to school principals' work and workloads as directly associated with their health and wellness concerns (Whitaker, 1995). Presently, much academic research and practice has focused on the well-being of students and teachers, with limited focus on school principals (Hendriks and Scheerens, 2013; Pollock et al., 2015).

Some parents, policymakers, and researchers might ask why principal wellness is such an issue in the public education sector—especially when a body of research clearly demonstrates that in schools, teachers have the most influence on student learning (Leithwood and Louis, 2012). Even though teachers have direct influence on student learning and there are more teachers than principals, principals play an important part in student and school success and system change as well. It has been established from

decades of research that principals indirectly affect student success (Hallinger and Heck, 1998; Leithwood et al., 2004); what is less commonly known is that principals also directly impact student success as well (Lee, 2021). Emerging research indicates that school principals do interact with students more than originally thought and that these interactions are significant both in terms of time on task but also impactful for students and their school success (Lee et al., 2021; Silva et al., 2011). How are students expected to receive quality education from school principals when many are struggling with their wellness and work intensification?

Principals play a key role in supporting students and teachers; they are critical for school and school system success. However, work intensification must be addressed for three main reasons: (a) work intensification is contributing to principal unwellness (Earley, 2020; Heffernan and Pierpoint, 2020; Wang et al., 2018a,b; Whitaker, 2003; Xiao and Newton, 2020); (b) unwell principals cannot support student success as effectively as well principals (Whitaker, 2003; Wang et al., 2018a,b); and (c) the job is becoming less desirable and there are growing recruitment and retention issues for the principal workforce in many countries as a result (Earley, 2020; Heffernan and Pierpoint, 2020; Whitaker, 2003; Wang et al., 2018a,b; Xiao and Newton, 2020).

Conclusion

This article explored what principals do using a work lens. It provided examples of some of the work that school principals do and a snapshot of some of the local and external influences on the nature of principals' work. The article concluded that many principals around the world find themselves experiencing work intensification. Because principals are the middle managers of public education school systems (Flessa, 2012; Kaul et al., 2021), the work they do will always be crucial. They champion new initiatives and system changes, are key supporters of students and teachers and pivotal change agents. It is crucial that politicians, policymakers, administrators, educators, and parents find ways to support principals in the important work they do.

Introduction

For well over half a century, scholars and practitioners alike have asserted the vital importance of school leadership to the success of schools and to the promotion of academic achievement for students. Initially, this claim seemed as much wishful thinking or the result of a chain of logical deduction as one supported by rigorous research. The more recent emergence of a considerable body of work based on well thought-out theoretical models which have been systematically examined empirically is an indicator of the field emerging from its adolescence. While it is unlikely researchers will discover a “unified theory” of effective school leadership, it is impossible to ignore the progress the field has made both in quantity and quality of attention to the questions: How does school leadership matter, and what do effective (impactful) school leaders do? (See, for example: Day et al., 2011, 2016; Gumus et al., 2018; Leithwood and Day, 2008; Leithwood and Mascal, 2008; Leithwood et al., 2010, 2017; Urlick and Bowers, 2014). Consequently, it is virtually obligatory in any scholarly work to reference the vital importance of school leadership to the success of schools worldwide—in fact, it is practically mandatory to mention that leadership is second only to quality teaching in importance among school-related factors that influence student achievement (Leithwood et al., 2008, 2017; Louis et al., 2010), a claim recently updated by Leithwood et al. (2020, p. 6) to read: “School leadership has a significant effect on features of the school organization which positively influences the quality of teaching and learning. While moderate in size, this leadership effect is vital to the success of most school improvement efforts.” This is not meant as a pejorative or sarcastic observation; quite the contrary, the progress scholars have made and the reasonableness and rigor of both evidence and resultant claims, especially when triangulated across settings and sources, is incredible.

An almost-equally compulsory requirement of scholarship on school principals, heads, or heads-of-school is to acknowledge that the role is horribly intricate and getting more so every year (Day, 2014; Horng et al., 2010; Huang et al., 2020; Oplatka, 2017; Robinson, 2011; Southworth, 2008; Wang et al., 2018). School principals’ work is described as “fragmented, relentless and stressful” (Bezzina et al., 2018, p. 842), increasingly diverse (Hauseman et al., 2017), and while leaders are continually admonished to focus on instructional leadership, evidence suggests that demands best described as bureaucratic and managerial tend to dominate their days (Grissom et al., 2013, 2015; Hauseman et al., 2017; Horng et al., 2010; Huang et al., 2020). In a recent analysis of a national sample of American middle school principals, Huang et al. (2020) characterized the principal’s day as unrelenting, hectic, largely reactive and unplanned; Earley and Bubb (2013) mention that just over 60% of headteachers in the UK characterize their work-life balance as poor. Their study showed that new headteachers felt challenged by isolation, external pressures, and a desire to distribute leadership without the requisite understanding of how to do this.

While leadership might be aptly described as varied and filled with ambiguities in any context, principal workload is extreme (Oplatka, 2017) and increasingly associated with negative outcomes such as burnout and turnover (Earley and Bubb, 2013; Hauseman et al., 2017; Maxwell and Riley, 2017; Türkoğlu and Cansoy, 2020; Wells, 2013; West et al., 2010). This leads to a vicious cycle—schools need high-quality leaders but the nature of the role and the toll it can take on incumbents results in potentially unsustainable turnover rates and fewer applicants for positions (Cierninski, 2018; Norton, 2002; Snodgrass Rangel, 2018; Teklelessie and Villarreal, 2011). This turnover is costly (Alenezi, 2020; Snodgrass Rangel, 2018), has an adverse impact on school performance and climate/culture (Mascal and Leithwood, 2010; Snodgrass Rangel, 2018), and particularly impacts the neediest schools (Alenezi, 2020; Beckett, 2018; Hansen, 2018) as well as charter schools (Ni et al., 2015; Sun and Ni, 2015).

Given the importance of school leadership to the mission and performance of schools, the challenging nature of the role, and the impact of consequences such as turnover, this paper focuses on the question: What does scholarship tell us about the quality of work life of school leaders? Specifically, the literature was probed to determine what is known about factors that are controllable by school and system leaders and policy makers that have been shown to have an impact on principal job satisfaction; efficacy; stress/burnout; and isolation. Taken together, these outcomes paint a picture of the quality of work life of school principals/heads, and understanding the malleable factors that could be used to enhance them may provide insight into how we might make the role more attractive and provide “space” for the continual improvement of school leaders.

Search parameters and opening considerations

To address the question posed above, a search was done across varied electronic databases for empirical research articles published in peer-reviewed journals, initially delimited to work published since 2010 and later extended back an additional ten years based on a review of papers first consulted in order to expand and triangulate the inquiry. The search was conducted using the keyword pairings depicted in [Table 1](#).

To further ensure that relevant empirical work was discovered, additional searches were done on ancillary keywords: "turnover/persistence/intention to leave," "workload," "social support," "working conditions," and "work environment/school climate/work setting."

Several initial considerations seem prudent to mention at the outset that may affect interpretation of the results, or at very least, are worth sharing with readers to augment trustworthiness. First, not surprisingly far more research has focused on teacher working conditions in schools rather than administrators or leaders. For the most part, this work was ignored—while conditions and many responsibilities between teachers and other school staff have some similarities, there are significant limits on the degree to which we might generalize from findings related to teachers and reasonably apply them to individuals who serve as principals, heads, or headteachers. Second, each of the factors investigated have a bipolar nature that complicates discussion. For example, while we will be seeking to understand what organizational factors might limit job stress, the absolute absence of stress is death and some degree of stress is absolutely essential to job performance. Similarly, while we hope to discover work-related factors that enhance job satisfaction, some degree of dissatisfaction is likely motivating and a benefit to individual leaders and the organization. Nevertheless, for simplicity, each was treated as unidimensional, e.g., that stress, burnout, isolation and dissatisfaction should be minimized.

Finally, all four of the constructs of interest in this paper are inherently subjective in nature and are most often operationalized using attitude surveys using well-established measures that have been subject to psychometric examination to establish validity and reliability. An issue that plagues investigation of all outcomes of interest related to emotions or quality of work life is that even though each has been widely measured, there are no universally accepted definitions and none have empirically-determined norms that would permit determining "levels" or a judgment of what "high" and "low" might be, even delimited by various contextual factors. Conceptually, even if norms existed, applying them to individuals or groups is complicated by the nature of the phenomena—individuals have varied experiences and abilities to cope with such things as stressors or experience with satisfiers and dissatisfiers. Consequently, studies tend to be relational in nature and seek to uncover constructs in the work world that could be manipulated to promote change in a direction rather than to discover an absolute level of "high" or "low." This suggests, though, that two basic kinds of leverage exist in relation to these factors: we might seek to lessen or minimize their incidence, or alternatively we can take steps to enhance individuals' ability to cope (or both).

Job satisfaction

Job satisfaction is an employee's favorable assessment of their job ([Chang et al., 2015](#); [De Nobile and McCormick, 2008](#)) and serves as a sort of omnibus outcome of interest. It is no exaggeration to suggest that job satisfaction is the most studied work outcome in organizational and management studies ([Locke, 1976](#)), dating back to Taylor's work on scientific management and the subsequent interest in human relations and leadership through the middle of the last century ([Bauer and Brazer, 2013](#)). [Hackman and Oldham's \(1980\)](#) work connects job satisfaction experienced by employees in different occupations to work design and factors such as role stress, and in a synthesis of research findings related to studies of job satisfaction in educational settings, [Thompson et al. \(1997\)](#) found factors such as role ambiguity and conflict to be among the most important predictors of satisfaction.

A variety of studies have been directed at understanding principal's job satisfaction (though considerably more work has been done related to teachers), and in contrast to the other outcomes featured in this paper, satisfaction is virtually always defined as a dependent variable predicted by personal, contextual, or job-related factors. Focusing on the latter, [Chang et al. \(2015\)](#) found that principals are more likely to be committed to their organization and more satisfied at work when they perceive their superintendents provide them with greater autonomy in their work; similarly, in a study of German principals [Dadaczynski et al. \(2020\)](#) found that decision latitude and sense of control is related to job satisfaction. In a study of Greek principals, [Saiti and Fassoulis \(2012\)](#) also found relations with supervisors to be important, including recognition for one's work and fair treatment.

In a study of principals in a US state, [Sodoma and Else \(2018\)](#) noted the general increase in duties and work pressure experienced by principals affecting stress and satisfaction, a finding echoed by [Wang et al. \(2018\)](#), who found "work intensification" to be related to job satisfaction of Canadian school leaders, and [Darmody and Smyth \(2016\)](#) who found workload-related variables to affect satisfaction of a sample of Irish headteachers. [Wang et al. \(2018\)](#) added, "Faced with increasing job expectations, contemporary principals are more likely to experience role ambiguity, overload, and conflict on a regular basis" (p. 75), thus exacerbating the situation.

Table 1 Keyword search parameters.

"Principal" or "head of school" or "headteacher"	and	"Satisfaction" or "job satisfaction" "Isolation" "Stress" or "job stress" or "burnout" "Efficacy" or "principal efficacy"
--	-----	--

Maforah (2015) expressed the workload issue a bit differently in noting that most principals find an imbalance between the effort they put into the job and the rewards—tangible and otherwise—that they receive from it. This may be especially true among principals in disadvantaged schools (Maforah and Schulze, 2012) and rural schools (Graham and Messner, 1998). Hu et al. (2016) found that salary and promotion satisfaction were related to perceived well-being, which were also related to job satisfaction, and Tran (2017) found pay satisfaction to be predictive of turnover intentions of principals, although Wang et al. (2019) found Korean principal's job satisfaction to be more related to symbolic prestige and authority than actual salary.

In a study using Teaching and Learning International Survey (TALIS) data, Garcia and Flores (2018) found that factors they describe as associated with bureaucracy (paperwork, excessive rules) most related to job dissatisfaction, whereas principals report greater satisfaction when they are able to involve others in decisions and promote leadership distribution. Hulpia and Devos (2009) also investigated the relationship between leadership distribution and principal satisfaction, finding that a cooperative and engaged leadership team was a strong influence on satisfaction, while the extent of distribution of leadership to teachers was inconsequential.

Conley et al. (2007) report that attachment to coworkers was an important predictor of job satisfaction for school principals and assistant principals, a finding supported by Chaplain (2001) in a study of primary headteachers who were particularly affected by support from mentors in the same role. In a study using the TALIS data, Liu and Bellibas (2018) found that while there were differences among countries studied, the most important predictor of principal job satisfaction—present for all 32 countries—related to social interactions and mutual respect among school staff. In a study of new principals in a single US state, Bauer and Brazer (2013) found that social support significantly reduced perceived isolation, which in turn enhanced job satisfaction, even when accounting for the negative effects of role ambiguity and overload. This affirms the central role of social relations and peer support as a satisfier.

A final point worth noting from the literature on job satisfaction is that among the four outcomes reported in this paper, satisfaction is most studied in relation to the others—that is, many of the studies reviewed involve appreciating the impact of efficacy, stress, burnout and isolation on job satisfaction, and as noted earlier, satisfaction is most often cast as a dependent variable. In rarer cases, however, satisfaction is a mediator—for example, Federici and Skaalvik (2012) first, and Bauer and Silver (2018) in a replication of their work, position job satisfaction as a mediator between efficacy and burnout, with satisfaction preceding burnout as a predictor of principal's intention to leave.

In sum, then, job satisfaction has been empirically associated with a variety of working conditions including workload; job attributes such as autonomy and scope of influence; and other work outcomes such as efficacy and stress. Schermuly et al. (2011) suggest that school systems might see dissatisfaction as a sort of “early alert” to the potential of leaders' impending burnout, and in a similar way, satisfaction is apt to be cast as an early warning of turnover. Let it suffice to say that the ways the four constructs discussed in this paper relate to one another is itself a worthy focus of empirical study.

Principal efficacy

Efficacy is an individual's belief about his or her ability to complete a task successfully (Bandura, 1997). In schools, the study of self-efficacy has focused mostly on classroom teachers; research shows that higher levels of student achievement are associated with higher degrees of teacher self-efficacy and collective efficacy (Goddard et al., 2000; Tschannen-Moran and Woolfolk-Hoy, 2001). While empirical examinations of leader efficacy in schools are somewhat few in number (Federici, 2013), principal efficacy has garnered more attention recently. For instance, Leithwood and Jantzi (2008) found that higher degrees of principals' self-efficacy and perceptions of their schools' collective efficacy are associated with enhanced school improvement, and that principals' self-efficacy is malleable and susceptible to district influences. Louis et al. (2010) reported that principals' sense of efficacy related to school improvement is impacted by the degree of clarity and consensus on important school goals, and that both leader self-efficacy and sense of collective efficacy are important outcomes related to leader effectiveness. Higher levels of principal efficacy may be related to effective decision making (Baroudi and Hojeij, 2020) and principal's ability to lead change (Daly et al., 2011; Tschannen-Moran and Gareis, 2004). Principals with higher levels of efficacy tend to be more engaged at work and report higher levels of job satisfaction and lower levels of burnout (Baroudi and Hojeij, 2020; Federici and Skaalvik, 2012; Tschannen-Moran and Gareis, 2004). Grissom and Loeb (2009) remind us, though, that the causal direction between principal self-efficacy and school outcomes may be complex—principal self-efficacy might lead to more effective schools, but also principals may feel more efficacious in schools that are higher performing.

Efficacy is often characterized as an individual resource that leaders bring to the role (Guglielmi et al., 2012); consistent with this perspective, it is cast as a predictor of other work outcomes. Federici and Skaalvik (2011, 2012; also Federici, 2013), for example, conducted a number of studies related to leader efficacy of Norwegian principals, and this work paints a picture of the importance of leader efficacy as a predictor of various consequences, including work engagement (Federici and Skaalvik, 2011), job satisfaction and burnout (Federici, 2013; Federici and Skaalvik, 2012). Skaalvik (2020) positioned efficacy for instructional leadership as a predictor and it emerged as statistically significant in relation to engagement, emotional exhaustion, and intention to leave. Hesbol (2019) found principal efficacy beliefs to be related to perceptions of the school as a learning organization, i.e., principals with a more robust sense of efficacy were more apt to pursue ambitious improvements and had stronger beliefs in the capabilities of teachers and others to engage in such change. In a study set in Italy, Guglielmi et al. (2012) found efficacy to be related to enhanced engagement, but it was unrelated to principal burnout. Leithwood et al. (2020) identify self-efficacy as among the psychological personal leadership resources highly effective principals possess and develop.

Daly et al. (2011) found that threat of sanctioning under-performing schools within existing accountability frameworks may lower principal self-esteem. They further speculated that districts would tend to react rigidly in the face of threat and “shut down” options for creativity and change, creating a downward and reinforcing spiral—principals of schools under sanction experience self-doubt and lower self-efficacy while their districts reduce degrees of freedom and schools’ capacity for change, leading to a greater probability of dire consequences for the already-sanctioned schools. While it is unlikely that sanctions will disappear in the current policy environment, this work suggests that districts might do well to explore their reactions to threat and consider ways they might help promote principal and school staff efficacy that could lead to greater capacity for improvement.

In terms of work-related factors that may relate to principal efficacy, Leithwood and Jantzi (2008) note that most of the research on efficacy tends to focus on its outcomes rather than its antecedents. They elaborate that of antecedents studied to that date, most were evident in only a single study and those most studied tended to involve demographics or attributes unrelated to organizational policies and practices. Their study focused on district leadership and organizational conditions, which they found to be more related to leaders’ collective efficacy beliefs than to their self-efficacy, although all factors studied were statistically meaningful predictors of leader self-efficacy. The strongest predictors were emphasis on teamwork; focus on achievement and quality of instruction; and district culture (e.g., clear, well understood goals). Their integrated model of the relationships among variables related to collective and self-efficacy beliefs showed that district conditions, as an aggregate, was highly predictive of leader self-efficacy. Leithwood and Jantzi also found that district investment in instructional leadership development was the weakest relationship observed, prompting them to speculate whether such investment was more a symbolic gesture by districts than an actual commitment to change and growth.

In contrast to these findings related to professional development, Grissom and Harrington (2010) found that principal professional development enhanced principal efficacy, particularly participating in a formal mentoring, coaching or peer observation process, a finding supported by Gümüş and Bellibaş (2020) in a study of Turkish principals. They found that self-efficacy was supported by participation in leadership development, and that it played a strong mediating role between participating in professional development and self-reported engagement in learning centered leadership practices. In a study of Iranian primary school principals, incidentally, Hallinger et al. (2018) also found that self-efficacy affected principals’ report of instructional leadership behaviors.

Federici (2013) studied several work-related conditions as predictors of efficacy. Specifically, this study found that respondents who report greater autonomy and fewer job-related constraints to autonomy in their work reported feeling more efficacious, and both autonomy and efficacy contributed to their perceived job satisfaction. Bauer and Brazer (2010) examined how role stressors (ambiguity, role conflict, role overload), social support, and involvement in a coaching program affected new principals’ isolation and self-efficacy beliefs, positioning isolation as a mediator and efficacy as the dependent variable. They showed, first, that role ambiguity, role overload, and social support were significant predictors of principal efficacy, and that the role stressors remained important predictors when introducing isolation into the model with isolation mediating the effects of social support (i.e., greater social support predicted reduced isolation, which predicted greater efficacy).

In contrast to the other outcomes presented in this review, efficacy appears most often in the literature as a precursor of other work-related outcomes, suggesting that principal efficacy may have a wide-ranging array of resulting effects. In general, efficacy seems to be cast as malleable, but evidence is hardly definitive regarding, for instance, whether leadership development and other organization-sponsored efforts are generally effective at promoting leader efficacy. We might speculate, based on the evidence presented, that if school systems could work to clarify goals, provide greater autonomy, adjust workload, and provide opportunities for networking and support from others, school leaders might be both less isolated and experience greater sense of efficacy, resulting in additional positive results such as greater job satisfaction.

Stress/burnout

Stress has to do with a person’s ability to respond to and cope with factors in the work environment (Beausaert et al., 2016; Friedman, 2002; Klocko and Wells, 2015), whereas Maslach (2003) describes burnout as a prolonged, negative response to persistent stressors in the workplace. A leader’s ability to cope with stressors is thus related to burnout, which may be mitigated, in turn, by such things as social support. The inability to cope, over time, may result in negative physical, emotional, and cognitive job-induced symptoms (Federici and Skaalvik, 2012). While all living creatures are constantly interacting with their environment which, in turn, stresses them, and individuals can and do learn new and better coping mechanisms all the time, consistent stress beyond one’s coping abilities can be debilitating and result in serious emotional, mental, and physical repercussions. Burnout, which might be construed as a form of stress that incessantly exceeds coping capacities, is most often associated with emotional exhaustion; it has been particularly associated with helping or human-service professions such as the principalship (Friedman, 2002; Oplatka, 2002; Stephenson and Bauer, 2010), perhaps accounting for the fact that the majority of empirical research found dealt specifically with burnout. DeMatthews et al. (2019) explain that individuals in helping professions often interact with people who are distressed or experiencing trauma themselves and may become distressed themselves by their limited abilities to remedy these situations. Stress and burnout have been associated with a wide variety of unfortunate outcomes, including reduced job satisfaction, turnover, and decreased ability to do one’s job (Darmody and Smyth, 2016; Friedman, 2002; Gursel et al., 2002; Maslach, 2003; Mitani, 2018; Steward, 2014).

Stressors may be personal or organizational in nature. Focusing on the latter, it is unsurprising that the most often-mentioned precipitator of principal stress is related to the overwhelming complexity of the role and overload (Beusaert et al., 2016; Darnoddy and Smyth, 2016; Grissom et al., 2015; Gursel et al., 2002; Klocko and Wells, 2015; Mahfouz, 2020; Somech and Miassy-Maljak, 2003; Tikkanen et al., 2017). Wells (2013) reminds us that "although specific pressures might be new, the call for principals to accomplish great things with little support, and to be all things to all people is certainly not" (p. 337). Nevertheless, recent accounts suggest that demands have expanded at an unsustainable rate (Darnoddy and Smyth, 2016). As Mahfouz (2020) put it, "Increasingly placed under scrutiny, school administrators are under unprecedented pressure. They must work in dynamic, rapidly changing environments and are expected to adapt while remaining composed and positive" (p. 440). Not only have the number of demands increased in number, but principals are under ever-increasing pressure to accomplish more in shorter timeframes, seldom with added resources. And as helping professionals, she adds, "They are expected to take full responsibility for any conflict, misunderstanding or mistake that takes place in their buildings and to fulfill all of their duties with considerable urgency, which can be emotionally exhausting" (p. 452).

A variety of additional studies from a wide variety of contexts reveal additional stressors that may well lead to burnout and other unwanted outcomes. In a study of Zimbabwean administrators, Nhundu (1999) found lack of autonomy as a potent stressor, as was lack of resources (a finding shared in many contexts) along with paperwork and workload-related issues. Yildirim and Dinc (2019), in a survey of Flemish leaders, found that in addition to workload, principals who had higher levels of role ambiguity and role conflict also reported higher levels of burnout symptoms. In a survey study of Quebec principals, Poirel et al. (2012) found that stressors were mainly administrative and bureaucratic constraints, especially at the elementary school level. Tikkanen et al. (2017) found relatively low degrees of stress and burnout among a sample of Finnish school leaders, but noted social relations playing a role in the incidence of burnout. Gursel et al. (2002) found Turkish principals affected by low salary and lack of access to information needed to do their jobs, and Friedman (2002), in a study of Israeli school leaders, found that more than overload, the dominant stressors leading to burnout were related to parental demands and weak teachers (often leading to discipline issues).

In the US, Klocko and Wells (2015) repeated a survey study in 2009 and 2012. They found that at the initial data collection, the most stressful work characteristics were managerial in nature and included concerns over loss of revenues, no doubt fueled by the temporal proximity to the global crisis of 2008. Paperwork, insufficient time to get work done, and constant interruptions were among the highest stressors both years. Mahfouz (2020) conducted a qualitative study of 13 principals and found an abundance of stressors she organized into three groups: work-related; relationship-related; and time-related. Among the work-related stressors were constant change, power dynamics, and bureaucracy; time-related issues included family/work balance, overload, and no time for self-care. Mitani (2018) finds strong evidence that sanctions associated with high-stakes policies in the US exacerbate principal stress and turnover. Finally, Wells and Klocko (2018) pose an intriguing question: does the current and expanding expectation that principals distribute leadership emerge as a stressor and source of angst for leaders or does it offer the possibility of reducing pressure associated with workload? Or perhaps, the corollary: Do many or most school leaders have the skills and abilities to distribute leadership effectively?

There seems to be less written about possible coping strategies or remedies for stress and burnout than its incidence and causes (Poirel et al., 2012), or as Mahfouz (2020) found in her qualitative study when she interviewed thirteen US principals, respondents reported far more stressors than coping strategies. Having a healthy work-life balance (Steward, 2014) and learning self-regulation strategies (Tikkanen et al., 2017) are recommended, and developing effective time-management skills was found to reduce job stress (Grissom et al., 2015). If there is a theme among the rather limited sources, it may be that increased quantity and quality of social support helps mitigate stress and burnout (Beusaert et al., 2016; Stephenson and Bauer, 2010). Chaplain (2001) found that the quality of relationships matter, and that headteachers found it especially helpful to receive support from other headteachers who could empathize and share their experience with their colleagues. Stephenson and Bauer (2010) found that increased social support and reduced isolation were among the most potent factors that mitigated or lessened emotional burnout, and Beusaert et al. (2016) found that certain types of social support decreased stress and burnout in their study of Australian school leaders. Specifically, they found that support from the broader community tended to mitigate burnout, which they speculate as related to the idea that feeling supported by the community makes principals feel more connected or a part of it.

Overall, the literature suggests that leaders' experience of stress is dependent on both the individual's ability to cope and adjust to environmental and organizational stressors, and factors controllable by the organization, and that repeated or persistent stress beyond this coping capacity may lead to burnout. If there is a prevalent theme in this literature, it is that the complexity associated with school leadership, work overload, and leaders' ability to control or influence what goes on in schools has a significant affect on the degree of stress and burnout experienced. Less seems to be known about coping strategies available to leaders, a deficiency that researchers and practitioners alike might do well to address.

Isolation

How is it possible, Cook et al. (2015) wonder, that individuals who are surrounded by literally hundreds of people and who are working in jobs that involve an unrelenting variety of tasks involving interaction with others might feel alone? "This is a conundrum of the modern world. In schools, we are in constant contact with teachers, parents, students, and community members, and yet we feel isolated" (p. 3)? And yet, isolation has affected the quality of work life for leaders and other professionals for decades (Ackerman and Maslin-Ostrowski, 2004; Bauer and Brazier, 2010; Bauer and Silver, 2018; Johnson et al., 2018; Stephenson and

Bauer, 2010), and may be an especially prevalent issue for new school leaders (Hobson and Sharp, 2005; Slater et al., 2018). The traditional egg-crate structure of schools is part of the explanation, but surely this affects teachers more than school leaders. Principals, however, are very much alone in terms of their role and responsibilities and have neither a peer group or true colleagues (Kelchtermans et al., 2011), even in larger and more complex schools with a variety of administrators. Ackerman and Maslin-Ostrowski (2004) identify isolation as "the endemic and chronic condition of leadership life" (p. 311); Kelchtermans et al. (2011) associates the structural loneliness of the role as linked to a struggle with belonging. This is exacerbated by the inherent role ambiguity and conflict associated with the position (Koromuz, 2016).

Cook et al. (2015) elaborate that in fact, education is not historically a collaborative industry; time for adults to work together is expanding with interest in distribution of leadership, communities of practice, and learning communities, but this is not historically valued. Johnson et al. (2018) found that even when teacher teams are employed in part to reduce isolation, they only do so tangentially; teams may be instrumental in promoting improvements in teaching, but such things as emotional support or collaboration are less central. Principals are held accountable and judged against criteria of effectiveness and efficiency, not either their or their subordinate's emotional well-being (Kelchtermans et al., 2011), and leaders may be reluctant to share problems, concerns, or other "weaknesses" with others.

Of the outcomes reported in this paper, isolation is the least studied in relation to the principalship (Bauer and Brazer, 2013; Koromuz, 2016; Stephenson and Bauer, 2010) and the literature on principal isolation is sparse (Beaudoin and Taylor, 2004; Cookson, 2005; Garmston, 2007; Hord, 2007; Schlechte et al., 2005). The concept of isolation has to do with the sense of feeling alone at work; it is less a structural reality than an emotional response. As schools have moved from being led by "principal teachers," to having principals that must take full responsibility for all of the administrative and instructional imperatives of complex organizations (Cuban, 1988), even today as we stress leadership capacity as a schoolwide attribute principals retain sole responsibility for school outcomes and make many of their key decisions in isolation.

A study conducted by Izgar (2009) shows that there is a statistical link between measures of principal loneliness and depression, and Cubitt and Burt (2002) found that isolation (loneliness) and work overload were the most significant predictors of stress among primary principals in a study set in New Zealand. Howard and Mallory's (2008) work supports the inclusion of isolation as a variable that operates in concert with the stress created by principal job expectations in the form of role ambiguity, role overload, and role conflict, and similarly, role ambiguity, conflict and overload were found to be statistically related to greater levels of isolation in a study of new principals in a US state (Bauer and Brazer, 2013; Bauer et al., 2019). In a study of Turkish school leaders Koromuz (2016) determined that communication and lack of time/overload were the most impactful work-related conditions associated with isolation.

In a study of recent graduates who became principals, Nichols and McBride (2016) found that social relationships, especially from former peers, contributed to resentment from those who may have been passed over for the position and isolation from former teacher peers. A study of new school leaders set in Malaysia found that while the incidence of loneliness was moderate, isolation was exacerbated by workload demands, autocratic leadership, and poor relations with teachers (Tahir et al., 2017). In contrast, studies of networking, mentoring or collaborative leadership learning found that isolation could be reduced through enhancement of collegial and mentoring relationships with professional colleagues (Hansford and Ehrich, 2006; Piggot-Irvine, 2004; Service et al., 2018). Trust et al. (2018) suggest that reduced isolation can be accomplished through social media and other on-demand learning and networking technologies.

To summarize, among the work outcomes reviewed in this paper, isolation represents a bit of a paradox; school leaders are in relationship with and regularly interact with many individuals during any workday, and yet they sometimes feel alone. Further, they are uniquely responsible and accountable for myriad consequences related to what schools do, including safety and learning. And in many school contexts, leaders are expected to have a depth and range of expertise that can be genuinely daunting. While the empirical work on isolation is relatively scant, one theme that appears well-supported from the few empirical studies on isolation is that the quality of collegial relationships at work are related to the degree of isolation experienced by school leaders (Bauer and Brazer, 2010; Bauer et al., 2019; Beusaert et al., 2016; Kelchtermans et al., 2011).

Discussion

A few things might be concluded from this review that can assist those who want to better understand the work and work lives of school leaders, improve those lives, and consequently improve the schools. There are several variables that emerge in relation to more than one of the work outcomes reviewed that may be relatively easily addressed that could improve the work lives of school leaders, among them: role stressors, particularly work overload and role ambiguity; communications, networking opportunities, mentoring and social support; and autonomy and decision-making control. The fact that these constructs are themselves related makes this even more important. We might speculate, for instance, that demands on principals to perform as instructional, transformational and managerial leaders makes their work more complex and leads to a much greater likelihood that they will experience role ambiguity, conflict, or overload on a regular basis; restrictions on their autonomy or lack of opportunities for social support might easily exacerbate or otherwise complicate their ability to lead and problem-solve effectively.

In addition, several questions recur throughout that might serve as suggestions for attention by researchers, aside from the obvious one that more research is needed in relation to each of these work outcomes for principals. Among them is the fascinating question of the impact of leadership distribution on each outcome and particularly, assuming school leaders have the skills and

vision to distribute leadership and followers have the capacity to successfully contribute as leaders, does this reduce isolation, stress, and work overload of principals and lead to greater job satisfaction and/or efficacy?

A significant limitation of this paper is the emphasis on the four constructs of interest as dependent variables; by stressing the work-related factors that predict each, we neglect the possible inter-relationships between and among these factors and how examining them as connected phenomena might promote greater understanding of the work experience of principals and thus provide only a limited picture of the ways principal quality of work life is affected and might be enhanced. As Conley and Woosley (2000) note, the relationships among variables associated with the design of leaders' work and outcomes like job satisfaction is unlikely to be "simple and direct" (p. 181), but rather mediated by factors associated with the work context. Throughout the discussions presented, of course, some literature dealing with each construct as a predictor rather than outcome was presented, and yet it seems quite likely more complex relationships exist between and among each AND among these variables and other outcomes such as persistence, job effectiveness, and perhaps even school effectiveness. Some few pieces were found that probe these relationships, for instance, Federici and Skaalvik (2012) and Bauer and Silver (2018) examine the relationships between principal efficacy, job satisfaction, and burnout in relation to their impact on principals' intention to leave their job (with Bauer and Silver adding the impact of isolation as a precursor). However, considerably more research needs to be done to tease out these more complex relationships and better understand the opportunities that might exist to help enhance the quality of work life and work outcomes for leaders.

The most important take-away from this review is expressed eloquently by Ackerman and Maslin-Ostrowski (2004): Much of what is studied and written about school leaders centers on aspects of leader behavior, what effective leaders do (or should do), and the impact leaders have on organizational outcomes rather than who leaders are or what they experience at work. "The leadership life," they write, "... is a complex balance of conflicting forces and tensions that manage to function most of the time. Leadership is 'practiced' at an extremely busy and sometimes hazardous intersection of the personal and professional where there is often a thundering flow of traffic" (p. 317). While it is certainly true that scholarship on the role of the principal has gained in both volume and quality over the past few decades, hindsight—and this review—suggests that we understand much more about effective school leadership behavior and its impact on teachers and students than we do about the quality of work life of school leaders themselves, their well-being, or how to enrich their work lives. We might wonder, consequently, whether we contribute what we should to leaders' abilities to perform their vitally important role or enhance, as we might, their motivation to do so.

Introduction

High-needs schools, or those with repeated low student achievement and other compounding challenges like poverty and lack of resources, demand more of principals than their lower-needs and higher-resourced counterparts (Finnegan and Stewart, 2009). Challenges associated with leading high-needs schools are typically greater, particularly when facing accountability pressures, requiring nuanced actions and considerations by school-based leaders and those who support improving teaching and learning in these schools (Cosner and Jones, 2016). Since the positive impact of the principal on student success is second only to that of teachers (Leithwood et al., 2020), the principal's role as an instructional leader who leads teaching and learning improvement is particularly crucial in high-needs settings. In order to best support high-needs schools, principals must secure additional and strategic resources, focus resources on the instructional program of the school (Klar and Brewer, 2013), engage in practices to increase continuous improvement such as data monitoring and analysis (Day et al., 2016), and facilitate ongoing aligned professional learning for leaders, teachers, and staff, among other responsibilities (Finnegan and Stewart, 2009). In other words, principals of high-needs schools must engage in focused instructional improvement efforts.

Yet, principals cannot effectively lead instructional improvement by themselves, a reality that is particularly apparent in high-needs schools (Thessin et al., 2020). The school district central office plays a critical role in supporting these improvement efforts by providing supervision and support for principals (Thessin and Louis, 2020). Within the central office, the role of the principal

supervisor has gained renewed attention in the last decade as it has been identified as a key lever for principals' instructional leadership learning and development (Goldring et al., 2018; Turnbull et al., 2015).

To address this need for ongoing, school-based, professional learning to grow principals' skills as instructional leaders, many of our nation's largest urban school systems have responded by changing expectations for those who support and supervise principals (Honig, 2012; Thessin and Louis, 2019). To accomplish this goal, many large city school systems in the US have allocated additional funding to reduce the ratio of principal supervisors to principals (Goldring et al., 2018). These central offices have reshaped the role of principal supervisors to focus their work on providing intensive, job-embedded coaching to principals (Corcoran et al., 2013; Honig, 2012) while also continuing their responsibilities as evaluators. Principal supervisors in these districts support principals' learning as coaches who provide feedback, model practices, broker resources, engage in joint classroom observations and development of tools, prioritize time on task to instructional leadership development, and convene groups of principals for collaborative learning, among other tasks (Corcoran et al., 2013; Goldring et al., 2018; Honig, 2008, 2012; Honig and Rainey, 2014; Thessin, 2021; Turnbull et al., 2015).

For 16 months, from 2017 to 2018, we followed the work of 12 principal supervisors and the principals they supported at high needs schools in one large, urban Mid-Atlantic school district, to be referred to by the pseudonym of Cityline Schools (pseudonyms are also used for all participants and schools in the study). In Cityline Schools, about 60% of students qualify for free and reduced price meals and approximately 55% of district students are African American and roughly 36% are Hispanic. This site was selected due to its early implementation of a new model of principal supervision. The district had reduced the span of control for principal supervisors to approximately 12–17 principals per supervisor to facilitate increased focus on developing principals' instructional leadership capacity. At the time of the study, there were 14 principal supervisors who had all been former principals in the district. This particular school district had also facilitated professional learning for most principal supervisors on learning-focused supervision (Lipton and Wellman, 2013) and had dedicated additional personnel and resources to supporting improvement in the district's schools with the greatest needs for improvement.

The purpose of this chapter is to look across the findings that emerged from a series of examinations of our data set to report on what we now know about principal supervisors' work with principals in this large urban district that may inform supervisors' work and district policies in other large urban centers that seek to reorient this role (Reyes, 2021; Thessin, 2019, 2021; Thessin et al., 2020). Broadly, our findings show that the goal of building the instructional leadership capacity of the school principal to lead improvement can be achieved by a skilled principal supervisor. Results and implications from our study can inform other urban districts striving to support principals in learning to lead instructional improvement in high-needs schools.

In the following sections, we will first provide a brief overview of the methodology of our study. We will then present and discuss each of the four findings we will articulate. Following our discussion of these findings, we will consider implications for educational leaders as they consider how to support principal learning and growth through the role of the principal supervisor. We will then end with a brief conclusion.

Methodology

We relied primarily on a qualitative multiple case study design for this project, as described in prior publications (Reyes, 2021; Thessin, 2019, 2021). For one study, we utilized quantitative methods to analyze results of a survey administered to instructional leadership team members (Thessin et al., 2020). All study procedures were reviewed and approved by the Institutional Review Board at the university where the research team members worked and by Cityline Schools' Office of Research. A brief overview of methods will be provided below.

Data sources

Principal supervisors and principals were purposefully recruited for participation in the study based on their work at schools designated by the district as *high needs* due to the district's focus on facilitating leadership development and school improvement at these schools. These included Title I schools, schools that had received School Improvement Grants from the state, and schools that had consistently low student test scores on second grade reading assessment indicators. We invited principal supervisors who were assigned to at least one of the high-needs schools in the district to join the study. After five principal supervisors consented to participate, we contacted and invited all principals whom they supervised who were leaders of high-needs schools. Twelve principals enrolled in the study, with each principal supervisor overseeing two or three principals who joined the study. A summary of the participants is included in Table 1.

Interviews

We conducted two 50–90 min interviews with each of the five principal supervisors (10 interviews total) and each of the 12 participating principals (absent one principal who elected not to complete the second interview, resulting in 23 principal interviews). The first interview took place when the participant joined the study, the second at the conclusion of the study. We designed and utilized semi-structured interview protocols that included questions on both the nature of principal supervisors' work with principals, such as the frequency and structures of their work, and the actual practices the principal supervisors utilized with principals. ^bPrincipals who demonstrated evidence of engagement in joint work in this study.

and principal supervisors were asked about the practices they engaged in that contributed to principals' instructional leadership learning and development and about specific events and actions we observed.

Observations

We conducted 86 observations, ranging in length between 1 hour and a full day, totaling nearly 150 observational hours over the 16-month period of the study. We observed a variety of interactions between principal supervisors, principals, and school teams, including one-on-one meetings; team meetings; and central office network meetings that included members of the school-based instructional leadership team and central office administrators who supported their work.

Documents

To supplement our interviews and observations, we also collected documents related to supervisors' work with principals and school-based teams, including meeting agendas, feedback summaries, protocols, and tools used by principal supervisors and principals. The documents we gathered helped us to acquire a clearer understanding of the interactions between the supervisor and the principal at each school.

Surveys

To understand the relationship between principal supervisors' interactions with their instructional leadership teams (ILTs) and team members' perceptions of their schools' leadership and organizational conditions, we administered the Internal Coherence Survey (Stosich, 2014) in spring 2018 to ILT members in 10 schools who agreed to participate in this portion of our study (Thessin et al., 2020). The Internal Coherence Survey, which was previously piloted and validated (Elmore et al., 2014; Forman et al., 2017; Stosich, 2014), focuses on three domains of leadership practice that research strongly links to school improvement. The principals of the ten schools distributed a link to the online survey to their ILT members but had no other involvement in the survey data collection and were unaware of which ILT members completed the survey. The overall response rate for the survey was 74% (87 out of 117 possible participants).

Data analysis

Descriptive coding was appropriate for this analysis due to the numerous types of data being coded and the extended length of the study (Saldaña, 2013). Through each iteration of our data analysis process, new research questions arose for us that led us to review additional literature relevant to our new questions. We then reinitiated our codebook development by deriving deductive codes from our review of the body of literature relevant to our analysis. During our coding process, we paid particular attention to themes that emerged to identify new inductive codes and to instances in which codes overlapped. We strove to achieve intercoder agreement by having each member of the research team first independently code one-two observations or interviews at a time, after which we continually compared and revised the code definitions we had previously written (Saldaña, 2013).

We coded interview transcripts and all notes from observations using AtlasTI software, and all research team members wrote reflective memos following each observation and after coding each interview. We utilized documents we gathered as additional evidence to confirm, or negate, themes that emerged during data analysis.

To analyze our survey results, we examined the consistency of responses within the sections of the survey, each of which measured a separate construct of the Internal Coherence Framework (Stosich, 2014). We found a great deal of consistency within sections, with alphas ranging from 0.85 to 0.94 for the eight measured constructs; we therefore computed the mean score for each respondent for each section of the survey (Thessin et al., 2020). We then created tables and figures of means for each construct measured by our survey, both overall and based on categories of principal supervisor involvement with ILTs that emerged from our qualitative analysis. We tested for statistically significant differences between group means using simple linear regressions where the dependent variables were individual ILT members' ratings of the survey scales and the independent variables were indicator variables for these groups.

Findings

While interest in reshaping the principal supervisor role has grown in urban districts nationally in the last decade, support from outside foundations has also contributed to an increased interest in and attention to this role. The Wallace Foundation, for example, has been working to redefine the position of the principal supervisor to one focused on providing instructional leadership through the Principal Supervisor Initiative (PSI) since 2014. Goldring et al. (2018) articulated that in the third year of the PSI Initiative in six districts, principal supervisors commonly understood their role to be: "to support principals to improve schools" (p. 31). While the district in which this series of studies took place was not one of the six funded by the PSI, the intended outcome of refocusing principal supervisors' work on developing and supporting principals' instructional leadership across districts engaged in this work is ultimately to improve instruction in schools (Goldring et al., 2018).

From our 16 months of data collection and numerous analyses and reexaminations of our data, we concluded: (1) the qualities of the principal supervisor–principal partnership influenced the types of changes principals made to their instructional leadership practice through the support of the supervisor; (2) principal supervisors' and principals' engagement in joint work tasks provided the opportunity for principals' learning and practice development, and when these experiences were situated in a team context, other school-based leaders had the opportunity to benefit as well; (3) principal supervisors differentiated their support of principals through the development of partnerships and usage of contextual information; and (4) principal supervisors who engaged with school-based instructional leadership teams (ILTs) focused their interactions in specific areas, and the degree of these interactions related to ILT members' perceptions of the school's conditions for improvement. The work of building principals' instructional leadership capacity begins with the establishment of a productive principal supervisor–principal partnership.

Qualities of a productive principal supervisor–principal partnership

Background

Traditionally, the role of central office administrators has been to monitor the work of principals but not to engage in the work themselves (Honig, 2012). Principal supervisors are now being asked to facilitate learning about instructional leadership for principals as a coach, while still serving in a dual role as a supervisor, historically a role of overseeing, approving, and evaluating (Thessin, 2019). As the span of control for principal supervisors was reduced, Goldring et al. (2018) suggested that the change in the nature of interactions between the principal supervisor and the principal also changed the nature of their relationships.

A number of sources in the principal coaching literature and in the field of executive coaching highlight the need for an effective working relationship between the coach and coachee to facilitate changes in practice (Baron and Morin, 2009; de Haan et al., 2011; Huff et al., 2013; Natale and Diamante, 2005; Thessin, 2019). Robertson (2009) describes how leadership learning occurs through professional partnership in stating "Approaching leadership learning through the concept of partnership means entering the relationship as an equal learner" (p. 40). A professional partnership also requires trust to be productive (Baron and Morin, 2009; de Haan et al., 2011; Feldman and Lankau, 2005; Huff et al., 2013; Robertson, 2009; Swinnerton, 2007). In light of the expectations for both principals' instructional leadership learning and improved student outcomes, the new principal supervisor–principal relationship is best described as a partnership to which both the supervisor and the principal contribute.

Summary of findings

As we engaged in our study, we noticed that some principals began to lead instructional improvement in new ways as result of the support of their principal supervisors, while others did not. We therefore examined how specific aspects of the principal supervisor–principal partnership affected the degree to which the principal grows as an instructional leader who can facilitate instructional improvement. We found that the types of changes principals made in their instructional leadership practice through the support of the principal supervisor varied from robust, to simple, to no change at all, with these degrees of change being influenced by qualities of the partnership (please see Table 2). We described productive partnerships as ones that generated *robust* changes in the principal's leadership practice, with robust being defined as changes to the way the school principal leads and builds instructional capacity in others (Thessin, 2019).

^aThese principals participated as members of the principal supervisor–principal pairs in the study on principal supervisor differentiation practices.

Fig. 1 Antecedents and contributions to the principal/principal supervisor partnership that facilitate engagement in joint work for improvement.

Of the 12 participating principal supervisor–principal pairs, we identified three that met our definition of a productive partnership. For these three, the partnership developed in three stages: (1) recognition of antecedent characteristics; (2) contributions of support and collegiality, coupled with principals’ motivation to learn, led to the presence of trust in the relationship; and (3) engagement in joint work led to changes in principals’ instructional leadership practice (Thessin, 2019). Fig. 1 illustrates the stages of partnership development that occur.

Stage 1

As antecedents to the partnership, principal supervisors brought both skillfulness and credibility (Baron and Morin, 2009; Huff et al., 2013) as coaches of instructional leadership to their partnerships with principals. Principal supervisors also brought past experiences as effective principals to their partnerships and further established their own credibility by engaging in joint learning and joint work with principals at the inception of the partnership. Principals brought a readiness to be a learner to the partnership and generally aimed to improve their own competencies as self-regulated learners (Zimmerman, 2002). Principal supervisor skills, combined with the principal’s desire to learn, led to the continued development of a productive partnership in Stage 2 (Thessin, 2019).

Stage 2

Principal supervisors in productive partnerships dedicated time to providing support and establishing collegiality with their principals (Huff et al., 2013; Robertson, 2009; Wise and Hammack, 2011; Wise and Jacobo, 2010). Principals contributed motivation, a readiness to lead the work of improvement as communicated by clear goals, and a willingness to engage in critical reflection (Baron and Morin, 2009; Bozer et al., 2013). Principal supervisors supported the achievement of these goals, offered feedback, and established the pathway to build trust that, in turn, led to a shared commitment to improvement.

Stage 3

In this final stage, principal supervisors and principals engaged in joint work. We found that it was through the act of collaborating on joint work that principals learned how to refine their practice as instructional leaders. Principal supervisors in productive partnerships did not direct the work of improvement for the principal, but facilitated the work jointly with the principal, and sometimes with other school-based leaders. Moreover, these principal supervisors approached their work as equal partners who both had a stake in the school’s progress and in each student’s success.

In productive partnerships, principals made robust changes to their instructional leadership practice by directly engaging in the work of improvement collaboratively with the supervisor. These changes were not made in isolation, but were modeled by, planned collectively with, or facilitated with the supervisor's guidance and support at the school site. Our finding of the importance of joint work for principal's learning and practice development led us to investigate the forms of joint work that occurred across all 12 of the participating pairs in our study.

Engagement in joint work

Background

Our finding on the potential significance of engagement in joint work for principal learning and development is supported by a few other recent studies on joint work among educational leaders (Honig, 2012; Honig and Rainey, 2020; Thessin, 2019). Honig (2012) first identified joint work as a practice that supported principals' development as instructional leaders. Cosner et al. (2019) described joint work between aspiring principals and leadership coaches by articulating episodes of mutual engagement in practice that took place between leadership coach/aspirant pairs when conducting joint classroom observations. Most recently, Honig and Rainey (2020) included *joint work moves* as one of seven teaching and learning approaches in their framework on how principal supervisors work with principals to facilitate changes in principal leadership practices.

In our study, we found that principals made robust changes in their instructional leadership practice primarily through engagement in joint work (Thessin, 2019). We also noticed that principal supervisors engaged in joint work with principals in varied situations, with some supervisors engaging in joint work with principals in larger team-based settings. This finding is supported by a small body of literature on the benefits of situating leader coaching interactions in large-group settings (Cosner et al., 2018), particularly since instructional leadership is now thought of as a collective endeavor (Robertson, 2009; Spillane et al., 2001). We therefore reexamined our data to understand the types of key work tasks taken up jointly by the principal supervisor and the principal and the situational contexts in which these joint work experiences occurred (Thessin, 2021).

Summary of findings

Using Honig's (2012) work to inform our thinking and our analysis, we defined joint work as, "*engagement in the work of instructional leadership by both the principal supervisor and the principal*" and applied this definition to interview and observational data sources among the 12 principal supervisor–principal pairs in our study (Thessin, 2021). We identified evidence of engagement in joint work between principal supervisors and principals in 7 of the 12 participating pairs in our study, and therefore relied primarily on data from these pairs in developing our findings (please see Table 1). Five of these seven had been identified as making either robust or simple changes in their instructional leadership practices through the support of the principal supervisor. For the other two principals, we did not have sufficient evidence to conclude that they made changes to their practice, but they did have developmental opportunities through engagement in joint work (Thessin, 2021).

We found that principal supervisors and principals jointly engaged in specific instructional leadership tasks that provided opportunities for practice-based experiences and leader development, including: (1) development and use of tools; (2) classroom observations; and (3) planning, facilitating, and reflecting on leading teams. We also found that these three types of joint work tasks generally took place in four different situational contexts: (1) as joint work in a dyad; (2) as joint facilitation of learning in a team; (3) through the supervisor's leadership of learning in a team with the principal participating; and (4) as joint planning followed by the supervisor's leadership of team learning (Thessin, 2021).

Development and use of tools

We observed principal supervisors and principals develop or modify tools and protocols together in a dyad, and then jointly utilize them afterward in a team setting. Examples of these tools included a Below Grade Level Monitoring tool, the stop light protocol, and a data analysis protocol for upcoming PLC meetings, among others (Thessin, 2021).

Classroom visits

Principals described the value of engaging in classroom visits in a dyad with their supervisor, which contributed to their capacity to provide effective feedback to teachers and provided an opportunity for them to reflect on next steps in improving instruction with their supervisors. At another school, the principal supervisor observed and then coached the principal on learning-focused supervision practices following his provision of feedback to a teacher. Then the assistant principal (AP) joined the next classroom observation, and the principal supervisor supported the principal as he coached the AP following her provision of feedback to a teacher after the observation. Both the principal and the AP benefited from the learning opportunity facilitated by the supervisor in this instance (Thessin, 2021).

Planning, facilitating, and reflecting on leading teams

At four of the seven schools, we observed principal supervisors regularly engage in joint planning for and co-facilitating of team meetings with the principal for the instructional leadership team (ILT), administrative team, or collaborative grade level teams. At a number of these school sites, this cycle of learning and improvement included reflection between the principal supervisor and the principal, and sometimes a broader group of leaders, as well. Further, these learning opportunities were situated in the four different contexts we articulated earlier. Principal supervisors situated leader learning in the context of

school-based teams to grow not only the principal's capacity to lead, but also the capacity of other school leaders, allowing other leaders to try out new instructional leadership practices as well. As one example, one principal supervisor actually jointly planned upcoming school improvement meetings with a school's APs, which the principal recognized as a direct opportunity for her APs to benefit from her supervisor's knowledge as well. Principal supervisors and principals who engaged in this ongoing cycle of learning and development in team settings recognized that the difficult work of school improvement could not be led by the principal alone.

Our examination of principal supervisors' and principals' engagement in joint work demonstrated four key takeaways: the value of situated learning in building principals' instructional leadership capacity; the principal supervisor's role in supporting learning for school-based leaders other than the principal; the collective ownership for school-based improvement demonstrated by supervisors and principals engaging in joint work; and the opportunity for engagement in other coaching practices, such as modeling and facilitation of learning through experience, through engagement in joint work. Further, these outcomes would not be possible under the traditional conception of the principal supervisor's role in which the supervisor offered feedback after an observation of the principal and then did not return to the school for weeks, or even months. At four of the schools in this study, the frequent, ongoing sequence of planning, facilitating, and reflecting on leading teams led to opportunities for practice development for principals and for other school-based leaders (Thessin, 2021). Achievement of this goal, however, particularly in the context of high-needs schools, requires the principal supervisor to know each principal's and each school's needs well through the use of a differentiated approach.

Principal supervisor differentiation strategies

Background

As an individualized practice, coaching has recently grown in popularity as a potentially effective and popular approach to professional learning, and leadership coaching has an increasing presence in education. Effective coaching, by its nature, offers the opportunity to provide differentiated support to principals because coaches work individually with their coachees (Baron and Morin, 2009; Huff et al., 2013; Weathers and White, 2015) on real-life situations that they face (Beusaert et al., 2016). Principal supervisors now engage in job-embedded professional learning for principals through coaching (Grissom and Harrington, 2010; Reiss, 2012; Spanneut et al., 2012), offering skilled supervisors the opportunity to differentiate their support and supervision of principals to best meet principals' and schools' needs.

Honig (2012) first highlighted six teaching and learning strategies that central office-based principal supervisors used to support principal learning and growth. The strategies were: engaging in joint work (as described in an earlier section), modeling, developing and using tools, brokering through bridging (connecting) and buffering (blocking), and differentiation. The strategy of differentiation was described as one that was used to strategically combine other strategies to individualize work based on principals' strengths and needs. While Honig (2012) shared some examples of supervisor differentiation, no other literature has gone further to determine, classify, or describe how differentiation works in the principal supervisor's practice. Much like teachers differentiating for students in a classroom, principal supervisors become the agile connector of learning based on needs, the content, and the individual principal. Through the analysis of our data set, we sought to understand how principal supervisors differentiated their practice to effectively grow principal instructional leadership.

Summary of findings

We analyzed a subset of our data that included two principal supervisors and their work with five principals, allowing us to illuminate the myriad approaches utilized to support principal learning and growth. We found that these principal supervisors differentiated their support through developing partnerships and using context and principal needs (Reyes, 2021). In three of the five pairs, the principal demonstrated robust changes in instructional leadership practice, and in a fourth, the principal made simple changes based on our evidence (please see Table 2). In the last pair, however, there was no marked change in principal instructional leadership. In this pair with no evidence of change by the principal, though, the principal supervisor still provided learning opportunities for other members of the school ILT. The findings described below focus on the three partnerships where robust changes occurred.

Specifically, we found that principal supervisors in these three partnerships differentiated by developing partnerships through (1) building collegial relationships, (2) fostering trust, and (3) building relationships with others in each school. Additionally, we found that principal supervisors used context and principal needs when differentiating through (1) engaging in observations and feedback, (2) using school data and principal learning needs, and (3) implementing cycles of goal-setting, learning, and reflecting.

Developing partnerships

Principal and principal supervisors alike described and demonstrated partnership through collegial relationships. Three of the five principals described their supervisors as someone they trusted, a partner in the work, and part of their team. They acknowledged their supervisors were also responsible for their evaluation and yet described the relationship as feeling equitable and not "top-down." Principals noted that this was not a usual feeling among their fellow principals. Furthermore, they all described times when their supervisors stepped in to support them in a moment of need. The development of this collegial relationship acted as the foundation for principal supervisors to foster trust.

When building effective partnerships, principal supervisors fostered trust. Through trust, principals shared openly and honestly. A principal described it this way: “I would just say she’s been very open and transparent about her success and even some of her failures and I think that’s just made me very comfortable with having that kind of dialog and interaction with her.” In the three relationships where principals made robust or simple changes in their instructional leadership practices, the principals repeatedly described trust that their conversations were confidential with their supervisor. For example, two principals shared during interviews that they knew the supervisor would not use their communication of need for support during challenging situations punitively.

Principal supervisors also differentiated their support to other school-based leaders, thereby supporting principal learning and school improvement in areas where support was needed. For example, principal supervisors led professional learning sessions directly with assistant principals on teacher observation and feedback at one school, and with school-based instructional leadership teams on analyzing data at another site. The principal supervisors were not seen as “strangers” in the building, but were known by teachers and staff. This development of collegial relationships with other school-based leaders strengthened the principal supervisor’s partnership with the school as well as with the principal.

Use of context and principal needs

In order to differentiate their support to principals, principal supervisors utilized evidence gathered through observation. For example, principal supervisors used evidence they gathered through both planned and unplanned school visits to inform coaching conversations with principals. These visits allowed supervisors to see principals as they facilitated meetings, led learning walks, gave teachers feedback, and met with parents/guardians or community partners. After these observations, many supervisors provided both written and oral feedback to principals. In the feedback, they often praised the principal first and then offered constructive feedback on an area of growth that might guide their future collaborative work or support achievement of one of the principal’s expressed goals.

Additionally, principal supervisors used school data and principal learning needs to inform differentiated approaches to providing support. During observations, principals and principal supervisors analyzed or discussed various kinds of data. Data included: student reading and math achievement data through Partnership for Assessment of Readiness for College and Careers (PARCC) or Measures of Academic Performance-Reading (MAP-R), the perception of principal leadership by the community through Vanderbilt Assessment of Leadership in Education (VAL-ED), teacher evaluation data, and even climate surveys. By triangulating these various data points, principal supervisors determined learning needs and next steps in their future work together. Through use of formal and informal data, principal supervisors also brokered resources based on principal and school needs.

Finally, principal supervisors implemented cycles of goal-setting, learning, and reflecting. In order to engage in this process effectively, it must be based on evidence from the principal’s own practice, connected to principal standards, and relevant to the school context. To address all of these characteristics, a principal supervisor must differentiate. One supervisor described her approach: “I’m trying to make the connections. I’m trying to connect from the previous work and loop it around to what we did that particular day for it to make sense as to where we need to go.” Principal supervisors helped principals connect their goals to feedback, new learnings, and next steps as part of the coaching cycle.

Principal supervisors built the instructional leadership capacity of principals through a variety of differentiation strategies. Their ongoing use of observations, data analysis, and regular communication ensured that principal supervisors understood and utilized contextual information to tailor their work with each principal. Further, our findings that principal supervisors differentiated their support of ILTs in varied ways across schools raised new questions for us that we sought to examine more deeply.

Principal supervisor interactions with leadership teams

Background

While principals have a central role in leading school improvement, existing literature is also clear that principals cannot lead improvement on their own, particularly in high-needs schools. When principals and teachers share responsibility for instructional leadership, the quality of instruction improves, leading to gains in student learning (Leithwood and Jantzi, 2012; Marks and Printy, 2003; Printy et al., 2009). Principals who are effective instructional leaders not only improve teaching and learning in the classroom, but also build the capacity of the individuals they supervise and support to lead and sustain schoolwide instructional improvement efforts with them (Edwards and Gammell, 2016; Wenner and Campbell, 2017; York-Barr and Duke, 2004). Instructional leadership teams (ILTs), therefore, play an important role in school improvement efforts by engaging other school staff in improvement work (Portin et al., 2013).

In their new roles as partners with principals in school improvement efforts, principal supervisors also have the opportunity to contribute to principals’ growth as coaches for other school-based leaders, and to the growth and development of instructional leadership team (ILT) members directly (Thessin et al., 2020). Further, in the Model Principal Supervisor Standards (Council of Chief State School Officers, 2015), one of the central responsibilities of principal supervisors is to “help principals create distributed leadership systems and structures that support teaching and learning” (p. 19). Still, districts have not specified the principal supervisor’s role in supporting the work of school-based leadership teams. In light of the potential influence that principal supervisors could have on the work of ILTs and the principal’s own role in leading the ILT, a role of greatest consequence in high-needs schools, we sought to understand how principal supervisors interact with ILTs to establish the conditions for instructional improvement.

Summary of findings

Across one district, over our 16 months of data gathering, we observed principal supervisors take differing approaches to their interactions with school-based ILTs. We therefore analyzed our data sources, including a survey administered to ILT members, to explore the degree and focus of principal supervisors' interactions with ILTs. We also examined whether these interactions were related to the ILT members' perceptions of the leadership and organizational conditions that are conducive to school improvement (Thessin et al., 2020). As only ten school principals elected to administer the survey to their ILT members, data from these ten schools were analyzed for this portion of the study.

Degree of interactions

While some principal supervisors interacted directly with ILT members to support team members' learning and development, others discussed the role of the ILT in coaching conversations with the principal, but did not have direct interactions with ILT members. To analyze this variation in the degree of interactions, we grouped schools together in three categories: "minimal interaction" between the supervisor and ILT, "some interaction," and "a great deal of interaction." At four schools, the schools with "a great deal of interaction," the principal supervisor interacted directly with ILT members by collaborating with the school principal (or other school leaders) in planning ILT meetings, modeling facilitation of ILT meetings, and leading professional learning at ILT meetings, among other actions. At these schools where principal supervisors engaged in a great deal of interactions with the ILT, principals identified their supervisors as members of the team with whom they collectively owned the work of improvement (Thessin et al., 2020).

Focus of interactions

We found that principal supervisors' interactions with principals regarding the work of the ILT, and with ILT members directly, fell within three categories of the internal coherence framework (Elmore et al., 2014): (a) leadership for learning, (b) professional development, and (c) support for teams. (a) We observed leadership for learning with the ILT when principal supervisors visited classrooms with members of the ILT, discussed observations, and planned feedback to provide to the presenting teachers. At times, these learning walks were also joined by the district's Deputy Superintendent (Thessin et al., 2020). (b) In schools with a great deal of principal supervisor involvement in ILT work, principal supervisors often designed, facilitated, and co-facilitated professional learning opportunities for ILT and administrative team members. These professional learning experiences included how to utilize new data tools, analyze data for the purpose of differentiating instruction, engage in school improvement processes, form effective teams, observe classroom instruction, and provide feedback to teachers. (c) In some cases, supervisors provided support for teams by interacting with grade level or content area teams with the principal and with one or more members of the ILT. In four schools in which there was a great deal of interaction with the ILT, principal supervisors also engaged in a regular cycle of planning, facilitating, and reflecting on leading teams, as described previously (Thessin, 2021).

Relations of principal supervisor interactions to ILT members' perceptions

We found that the perceptions of ILT members of their schools' conditions for improvement differed depending on the degree of principal supervisor interactions with the ILT. ILT members' perceptions of their schools' leadership and organizational conditions for improvement at schools with "some interaction" and "a great deal of interaction" by the principal supervisor were more positive than ILT members' perceptions of the conditions for improvement in schools with "minimal" interactions by the principal supervisor. It is therefore possible that principal supervisors' interactions with ILT members contributed to their perceptions of the conditions for improvement, but further research is needed to understand this relationship.

Based on our findings, there are many potential benefits to the principal supervisor's interactions with school-based ILTs, including additional learning opportunities for principals and for ILT members and likely contributions to ILT members' perceptions of the school's readiness to engage in improvement practices. Still, principal supervisors interacted with ILTs in these potentially beneficial ways at only four school sites in our study, suggesting that there is a lack of understanding of whether, and when, the principal supervisor should be engaging in these ways with school-based ILTs.

Implications for practice and policy

Based on our study, there is clear evidence that principal supervisors who establish productive partnerships, engage in joint work, differentiate their support, and interact with school-based leadership teams contribute to changes in principals' instructional leadership practice, to the leadership growth of other school-based leaders, and to school improvement efforts (Reyes, 2021; Thessin, 2019, 2021; Thessin et al., 2020). To grow this impact, increasing numbers of urban districts are reexamining the role of the principal supervisor to ensure supervision is focused on building principals' instructional leadership capacity, as opposed to the traditional compliance and accountability-focused supervision model. Yet, this redesign process requires thoughtful planning and clarity of expectations at the district level, and additional guidance through the continued refinement of national standards. Even greater attention to the role of the principal supervisor is warranted for those principal supervisors who support high-needs schools, where students have not been served well by the educational system over time. Four specific implications for practice and policy at the school district level and at the national level are articulated below:

Prioritize selection and preparation

In order to change the traditional focus of the principal supervisor role, district leaders must first select principal supervisors who are ready to provide job-embedded professional learning to principals as a coach and partner in the work of school improvement. The selection process for principal supervisors should consider candidates' practices and abilities beyond their effectiveness in past roles as principals. Subsequently, individuals selected for the principal supervisor role should be given the professional learning and support they need to effectively build principals' instructional leadership capacities, beginning with those supervisors who support principals at high-need schools. Throughout the professional learning experience, focus should be paid to the principal supervisor standards, district expectations for the role, coaching strategies to provide ongoing learning for principals in their work, and the understanding that supervision is an ongoing process between the principal supervisor and principal. Further, those districts that have redesigned the principal supervisor role should ensure senior district leaders are prepared to model this type of support and supervision through their work with principal supervisors.

Communicate clear expectations

School districts need to provide not only ongoing professional learning to all principal supervisors who are selected for the position, but also clear guidance and expectations for their work. As we found in our study of 12 principal supervisor–principal pairs, the degree to which principal supervisors were successful in supporting principals' instructional leadership growth to facilitate improvement varied significantly across pairs. This wide variation in one district likely resulted at least partially from a lack of clear expectations for and supervision of the role of the supervisor. In this district, a key criterion for the selection of principal supervisors was a track record as a successful principal (as viewed by those directly involved in the principal supervisor selection process); yet, successful principals may not be effective principal supervisors, as we found in our study. Principal supervisors also shared that the district's evaluation rubric for their roles did not align with the district's new focus on coaching and instructional leadership support for principals. In the absence of clear expectations for changing their practice, leaders are likely to continue to lead as they have traditionally led in prior roles, roles which likely did not prioritize instructional leadership growth through the provision of support and job-embedded professional learning.

Establish thoughtful partnerships

Principal supervisor–principal partnerships should be established strategically and sustained over time. Partnering based on principals' needs and principal supervisors' abilities and strengths provides increased opportunity for robust changes in principal practice to occur. In order for principal supervisors to be able to work directly with the principal to meet learning needs and further support school teams to increase school improvement and effectiveness, there must be enough time and opportunity to know the principal and school context well. Through time and the building of partnerships, principal supervisors will be able to engage in more frequent, aligned, and strategic coaching cycles over time. Each cycle can enhance the principal's learning and further the school in its improvement efforts. This depth can increase only through continuous relationship- building and strategic coaching with the principal and members of the instructional leadership team.

Support learning of school-based instructional leadership teams

We assert that the title *principal supervisor* underestimates the power of this individual to facilitate learning that is consequential for practice development for principals and for school-based leaders more broadly (Thessin, 2021). Yet, principal supervisors have differing understandings of the degree to which they should interact with and support school-based ILTs, if at all. Clear guidelines from school district leaders to support not only the school principal, but also the increased instructional leadership capacity of ILT members, may help in this regard. By situating learning within the ILT, the principal supervisor can partner with the principal to establish the organizational conditions needed for improvement and build ILT members' skills to lead this challenging work. Distributing leadership of improvement also increases the possibility for instructional leadership practices to become embedded at the school and for improvements to continue even if principals change. Additionally, refining the Model Principal Supervisor Standards (Council of Chief State School Officers, 2015) to further specify the role of the principal supervisor in supporting the learning of school-based ILTs on a policy level may provide districts with additional leverage to make refinements at the local level (Thessin, 2021).

Conclusion

Research conducted over the last ten years has begun to show that the role of the principal supervisor is critical to principals' instructional leadership practice. Based on findings from our studies of one urban district's approach to a new model of principal supervision, supervisors have the potential to contribute to school improvement efforts, particularly in high-needs schools in which improvement is needed quickly, by facilitating both the principal's instructional leadership learning and the learning of other school-based leaders. As we found, however, principal supervisors bring a wide range of approaches to their role and to their

work to supervise and support school principals. Districts must therefore consider how to: align the hiring, professional learning, and evaluation of principal supervisors to the revised role; partner principals and supervisors strategically and sustain partnerships over time; and specify expectations for the revised principal supervisor role through policy at the district and national level.

As we have learned from urban districts engaged in this work, revising the principal supervisor role from a role focused on management and compliance to one focused on instructional leadership is a significant shift that the entire district must be ready to support. As more districts engage in this work, and as interest in shifting the principal supervisor role grows in suburban and rural districts as well, further research will be needed to understand how the supervisor's role can be most supportive to principals' growth as instructional leaders in other contexts.

Introduction

Improving Indigenous children’s lives such that their health and education outcomes compare favorably with more mainstream peers has been an ongoing challenge for Western governments. We take Australia as a case since it exhibits many of the issues that impact the education of Indigenous children in post-colonial societies. In spite of significant policy reform and investment over a lengthy period, targeted improvements have been largely disappointing. In the Australian setting, since the implementation of the Closing the Gap strategy in 2008 which was intent on reducing disadvantage in the Indigenous Australian populations and measuring improvement, achieving sustained results has proven equally elusive. After 12 annual reports documenting change in seven targets, just two are on target to reach their goals: early childhood education (By 2025, increase the proportion of Aboriginal and Torres Strait Islander children enrolled in Year Before Fulltime Schooling [YBFS] early childhood education to 95%) and Year 12 attainment (By 2031, increase the proportion of Aboriginal and Torres Strait Islander people [age 20–24] attaining Year 12 or equivalent qualification to 96%; see <https://www.closingthegap.gov.au/targets>).

The latest Close the Gap report, “We Nurture our Culture for our Future, and our Culture Nurtures Us” (The Lowitja Institute, 2020), designed by the Lowitja Institute for the Australian federal government’s Close the Gap Steering Committee, was released in March 2020. It recognizes that poverty and economic disengagement have been barriers to success. However, there are impediments of a more fundamental and ideological nature, specifically in terms of governance reform. The 2020 Closing the Gap strategy calls for equal decision-making between government and Aboriginal people at local, regional, state and national levels. Following the advice of community elders is all important in changing the context in which Indigenous Australian people live. Increasingly, implementation of such policies is being recognized as a value-laden process which not only identifies and measures social problems but also produces and reproduces them through discourse (Dawson et al., 2020). Understanding how deficit discourses are produced and reproduced is essential to challenging them (Fogarty et al., 2018).

The Australian federal government’s 2020 national Agreement on Closing the Gap strategy commits all Australian governments to 16 targets, three of which are related directly to early childhood and school education. These are:

- To increase the proportion of Aboriginal and Torres Strait Islander children enrolled in early childhood education to 95% by 2025;
- To increase the proportion of Aboriginal and Torres Strait Islander children assessed as developmentally on track in all five domains (physical health and well-being, social competence, emotional maturity, language and cognitive skills, communication skills and general knowledge) of the Australian Early Development Census (AEDC) to 55% by 2031; and
- To increase the proportion of Aboriginal and Torres Strait Islander people (aged 20–24) with a Year 12 or equivalent qualification to 96% by 2031.

¹The term “Indigenous Australian” has been used in this article to represent Aboriginal and Torres Strait Islander peoples of Australia, while “Indigenous” refers to first nations peoples more broadly.

Writing for *The Conversation*, [Graham et al. \(2020\)](#) argue that although these targets are warranted, they miss the mark, particularly in the way “success” is to be measured. Success needs to be measured in Indigenous as well as Western terms, especially with respect to meeting educational targets.

Our literature review aims to find out more about “what does (not) work and why” in a range of Indigenous and other low-socioeconomic contexts for improving educational outcomes for children from birth to school leaving age, inside and outside school. In our development and research agenda over the past 10 years, use of the theory of “leadership for learning ‘both ways’” has proven beneficial in making a difference in Indigenous education contexts. It is therefore fitting that we have again employed the concepts inherent in leadership for learning both ways to our collection, analysis and discussion of review materials leading to a set of interrelated premises that hold unprecedented possibilities for empowering Indigenous families and communities to work with schools in positively reshaping children’s futures.

Briefly, the leadership for learning both ways concept was borne and enacted during the Principals as Literacy Leaders with Indigenous Communities (PALLIC) project, through the mechanism of core participants: Indigenous leadership partners working alongside mostly white school leaders in the school, with a remit to lead engagement with their communities in children’s literacy learning ([Johnson et al., 2014](#)). The expression “both ways” refers to the value placed on both Western and Indigenous knowledges and was first articulated by Yolŋu educators in North-East Arnhem Land in the late 1980s. A metaphor was used to explain it which likens the meeting of knowledge systems to the meeting of two bodies of water in a lagoon where salt and fresh water come together ([van Gelderen and Guthadiaka, 2019](#)).

The PALLIC project was supported by an explicit position on school leadership in general and shared leadership in particular. Compelling research evidence has shown that quality leadership makes a difference to children’s learning and achievement, particularly in challenging school environments ([Bishop, 2011](#); [Day et al., 2010](#); [Hallinger, 2011](#); [Leithwood et al., 2006](#); [MacBeath and Dempster, 2009](#); [Masters, 2009](#); [OECD, 2008](#); [Robinson et al., 2009](#)). Added to this is the need for open “intercultural space” ([Taylor, 2003](#)) in which leadership both ways (Western and Indigenous) is accepted and valued in Indigenous schools and communities ([Ober and Bat, 2007](#); [Priest et al., 2008](#)).

Making improvements in learning and achievement requires both ways partnerships inside and outside the school to share the leading of reading ([Bishop et al., 2011](#); [DEEWR, 2009](#); [Hallinger and Heck, 2010](#); [McNaughton and Lai, 2009](#); [Ober and Bat, 2007](#); [PricewaterhouseCoopers, 2010](#); [Priest et al., 2008](#)). In practice, the Indigenous leadership partners and the school leaders worked collaboratively within the schools to enrich their personal and professional partnerships and the effects they might have on children learning to read. That this occurred is visible across the research findings: Indigenous leadership partners were highly respected by their principals, their teachers and their Indigenous communities, while they themselves valued the opportunities presented by the role to build stronger partnerships both ways, not only with the schools but also with the children, their families and community members. The long-term intention was to teach and learn literacy through a shared Indigenous and Western knowledge base.

Methodology

There is no consensus on the standard structure of a narrative or traditional literature review. Therefore, we explain the methodology for locating and evaluating the literature first and then present the findings and discussion and the limitations of the review. Since 2010, our long-term strategy has been to build and progressively update a narrative review of literature, including relevant authored and edited books in the field as well as policy documents on the broader topic of Australian Indigenous education and relevant work from Canada and New Zealand. We have updated the broader literature review for the purpose of this article to provide a concise understanding of “What works and why?”. Subsidiary questions were used to critique the notions of “What works?” and “What does success look like from a variety of viewpoints?”

As a first step we examined our current database using keywords to identify the most relevant texts: Indigenous children’s learning outcomes; success; teaching and learning in Indigenous schools; leadership for learning in Indigenous schools; remote Indigenous contexts; Indigenous family, school, community engagement; community empowerment. Similar keywords were used to guide scholarly electronic database searches in identifying further research papers published in English language peer-reviewed journals. Databases employed were Scopus, Science Direct, PsychInfo, ProQuest, Web of Knowledge, Sage, Google Scholar and Google. Additional information was generated from reference lists and citation records of papers found in database searches.

The most recent search has included work—including recent policy documents—published in Australia and internationally between 2015 and 2020, because this timeframe is rich with critique of the current concepts and practices driving Indigenous education policy and practice in the Australian context. In this instance we have not tried to review all of the relevant literature in this paper. Instead, we have drawn out specific concepts that support/substantiate our premises.

A close examination of these documents has highlighted the understanding that “what works” is not just a matter of listing a range of initiatives that have shown promise in strengthening Indigenous students’ learning outcomes and futures, but that it is also important to delve deeper to distil the philosophical and ideological drivers underpinning them. We found no publications that reviewed the literature on these terms.

The next section presents the literature review findings and discussion as a central set of interrelated premises that, when shared by stakeholders, hold unprecedented possibility for reshaping the contexts of leadership for learning in Indigenous contexts—for a more diverse and equitable notion of success.

Findings and discussion: Four central premises to reshape learning within Indigenous schools and communities

Based on a concise narrative review of contemporary research and evaluation reports of initiatives implemented in Australia, Canada and New Zealand, we found four interrelated premises that are integral for all school leaders and other stakeholders intent on enacting change in the context of Indigenous children’s learning outcomes. The premises, in combination, represent a positive set of beliefs, values and ideologies that systems, policymakers, principals, teachers, and Indigenous elders, families and children must share if Indigenous children are to gain greater access to educational opportunities and the outcomes that are forthcoming from achievement during the early years and across their years of schooling and into further study and work.

Premise 1: A strengths-based approach to Indigenous education has the potential to reframe deficit assumptions

A strengths-based approach to improving Indigenous children’s health and learning outcomes is an overarching premise that needs to drive policy reform, new initiatives and programs. It represents a significant shift in mindset that has the power to change the context in which Indigenous children live and learn. However, the notion of whose strengths are valued has been a longstanding point of contention that has impeded change to date. In the main, policies and practices that aim to improve Indigenous children’s learning outcomes have embodied a deficit mindset that assumes Indigenous communities lack strength to impact positive change (e.g., [Sarra, 2011](#)). Indigenous educators have repeatedly called for a reconceptualization that acknowledges strength on all sides. Such an approach respects Indigenous culture, acknowledges the inherent strengths of families, communities and children, and recognizes that Indigenous children’s experiences growing up are culturally informed and shape their behavior and attitudes to education, health and life more generally. Within the 2020 Close the Gap Report, the narratives of Aboriginal and Torres Strait Islander people provided a strengths-based analysis of Aboriginal and Torres Strait Islander health and well-being. They explain further:

... a strengths-based approach does not overlook the relationship of power and inequality on health outcomes and the responsibility of governments in leading systems reform. The work of communities must be matched by governments through shared decision-making, equitable (and sustained) funding and a cohesive policy approach.

The Lowitja Institute (2020, p. 5).

In Australia, [Priest et al. \(2008\)](#) warned that too many educational interventions and initiatives take a deficit approach to Aboriginal and Torres Strait Islander parents and communities: a key factor known to impede progress of schools and disenfranchise families partnering to improve children’s learning outcomes. In a deficit approach the potential learning opportunities and existing accomplishments of Indigenous Australian parents and communities are ignored in favor of imposing strategies and initiatives that aim to fix the perceived shortfalls with a top-down approach to governance. Others have similarly argued that a deficit model constrains a genuine working partnership between government, school leaders, educators and Indigenous communities ([Beresford and Partington, 2011](#); [Fogarty et al., 2018](#)).

At the heart of a strengths-based approach to improving learning outcomes for Indigenous children is the need for policymakers to be more sensitive to the cultural beliefs and child-rearing practices of Indigenous families and communities ([Lohoar et al., 2014](#)) and to build continuities as children transition across home, care and educational settings ([Kellard and Paddon, 2016](#)). The underlying cultural values and attitudes that inform child-rearing practices in Indigenous homes, however, may often be unseen and unexplained ([Geia et al., 2013](#)), so there is a need to find ways to build cross-cultural understandings as a prerequisite for policy reform. The lack of understanding about the potential incongruence between the culture of an early childhood education setting and the cultures of Indigenous families and groups may lead to non-Indigenous educators undermining Indigenous family and culture, and to general racism in early childhood settings ([Grace and Trudgett, 2012](#)). This signals the need for new approaches to Indigenous education that facilitate place-based understandings and reform.

It is broadly acknowledged that the way all young children grow up is culturally constructed ([Krakouer et al., 2018](#)). Cultural values and beliefs influence the attitudes, expectations and emotional orientation of parents and caregivers in relation to the child-rearing and development of their children ([Muir and Bohr, 2019](#); [Wise and Sanson, 2000](#)). In considering the values, expectations and orientations that influence Indigenous children growing up, it must be remembered that Indigenous Australians are diverse ([McTurk et al., 2011](#)), and also that the cultural beliefs and values that inform Indigenous child-rearing practices vary significantly from Western traditions ([Grant and Yerlo, 2011](#)). [Wise and Sanson \(2000\)](#) argued that “the early childhood developmental goals valued by parents and educators in many Western societies reflect an underlying ‘individualistic’ cultural script” (p. 3). This individualist focus is characterized by the acquisition of competence, independence and competition. In contrast, [Wise and Sanson](#) suggest that traditional cultural groups usually value more collectivist or interdependent cultural scripts. In these groups, collective goals such as living in harmony with one another, competent participation in social events, and obedience to authority are valued more highly. It is reasonable to argue that many Western-based reforms to Indigenous education are generated from a focus on individual competence and therefore fail to utilize the strength of community-based knowledge and competencies that Indigenous families and children have to offer the learning process in schools. The Longitudinal Study of Indigenous Children ([Penman, 2006](#)) provides further insight into children’s experiences and the child-rearing practices within Indigenous families and communities

across Australia. The study revealed that Indigenous Australians believe that culture, respect and family harmony are the fundamental elements of family life, child-rearing and kinship maintenance. Penman explained:

... culture consists of complex systems of obligations and responsibilities that bind all members of the kinship system through a strong oral tradition. Respect reflects the absolute belief that all people are worthy of respect and it is right that others will pay them due regard. Family harmony is premised on the principle of reciprocity—a mutuality of expectations. (p. 35)

In the same study, summaries of reports on Indigenous attitudes to children and child-rearing practices for people living traditional or semi-traditional lifestyles and those in urban environments included the following common themes: children are not viewed as helpless and in need of adult-imposed routines; children are kept close and their needs met as they arise; and children are cared for by the whole extended family. Taylor (2011) noted that the skills of autonomy, sibling and peer solidarity, motor skills, visual-spatial skills and the capacity to self-judge and take risks are encouraged in Indigenous children from an early age. McTurk et al. (2011) suggested that many of these distinctive characteristics of Australian Aboriginal family systems demonstrate early learning. Yet such an approach to learning is very seldom acknowledged in schools (Kellard and Paddon, 2016).

Many of the initiatives examined do not recognize the powerful insights, knowledge and cultural identities that Indigenous children bring to their schooling (Lohoar et al., 2014), nor do they recognize that learning for all children takes place in homes and communities from birth, as well as in schools. The differences in the goals and expectations of caregivers, which often mediate the daily experiences of Indigenous children and their interactions with people, objects and symbols in their immediate environment (Rosenthal, 2000; Santoro et al., 2011), must be considered in children’s learning if learning outcomes are to be profiled transparently with appreciation (Harrison et al., 2019; Parkinson and Jones, 2018).

School principals, educators and Indigenous leaders are in a position to build effective two-way communication practices and to create protocols for respectful interactions among educators, school officers and parents and carers as a means of understanding the learning support roles each is undertaking: to challenge the deficit context that often constrains Indigenous participation in schooling. However, while relationships that are mutually reinforcing, respectful and directed toward improving children’s learning are integral to the success of initiatives, they are often difficult and slow to establish in particular communities and in systems more widely (Kendall et al., 2008).

Indigenous children are dependent on informed, sensitive educators in all care and education settings to ensure experiences are socially inclusive. This will only be achieved through community engagement, respect for culture, and genuine working partnerships with communities and between schools, homes and the broader community: the hallmarks of a strengths-based approach (Kellard and Paddon, 2016).

Premise 2: Working two ways or both ways across governments, systems, schools, families and communities creates new ways of leading and learning

Working two ways or both ways involves genuine consultation between Western-styled governments, systems, schools, families and communities and Indigenous people. The terms “two ways” and “both ways” are used interchangeably (Disbray, 2016). Broadly, both terms indicate the possibility for Indigenous people to develop strong intercultural identities supported by Indigenous and Western knowledges. It is widely understood that the two-ways or both-ways Indigenous inspired methodology (Robertson et al., 2017) is essential for understanding how Indigenous and non-Indigenous people might learn from each other (Smith, 2011). As van Gelderen and Guthadiaka (2019) state,

“bothways”, by definition, represents the legitimacy and power of different theories and epistemologies working together, whilst retaining their distinctiveness. However, “bothways” also represents the position that in the process of negotiating knowledge practices, new ideas and indeed, worlds are born. (p. 4)

These authors liken both-ways methodologies to transculturation, an exchange between two cultures in which something is always given in return for something that is received. In these exchanges, both cultures are active, contributing and cooperating, resulting in knowledge practices being modified and new, transformed realities emerging. In the forming of such partnerships, Christie and Grotorex (2004) have pointed out that the positioning of “authority” in Indigenous communities must be taken into account. For example, unlike a top-down Western leadership style, Indigenous Australians work in the opposite direction, “with the group endowing authority on the basis of expertise” (Guilfoyle, 2016, p. 40).

In practice, a both-ways approach to educational reform is underpinned by an ideological alignment to a strengths-based approach to Western partnering with Indigenous people; that is, not assuming that Indigenous parents and children are educationally deficit and therefore needing to assimilate into the dominant education system in order to be “fixed”. D’Arbon et al. (2009, p. 19), in their project called “Linking Worlds: Strengthening the Leadership Capacity of Indigenous Educational Leaders in Remote Education Settings,” have explicated what is meant by the radically alternative educational ideology, first developed in the mid-1970s by Pincher Nyurmiyarri, a member of The Gurindji, who were concerned that their children were receiving a “one-way”

education. The Gurindji, from remote Northern Territory’s Victoria River region, proposed a two-way education system that involved “reciprocity and obligation, involving curriculum, knowledge, policies and power” (McConvell, 1982, p. 63). It also encompassed an approach to learning within The Gurindji which aimed to “re-establish relationships between the younger and older generations, healing rifts that had developed in the transmission of knowledge.” However, at this point “two-ways” became a “domain separation theory” which saw Indigenous people contributing knowledge and culture as an “add on” to dominant education, but with little opportunity to innovate and practice leadership.

There has been a recent move to a more socially critical intercultural model in which the conceptual and practical understandings of both ways is (re)presented as two overlapping circles. The intersection between the two circles demonstrates how the new methodology moves from a focus on systems and schools merely consulting Indigenous people about contributing Indigenous knowledge and content to educational curriculum (“both-ways”) to a new set of practices where there are viable possibilities for Indigenous people “to shape and develop the educational programs and to implement them” (Wunungmurra, 1989, cited in D’Arbon et al., 2009).

An authentic both-ways approach recognizes the strength of Indigenous people to work within systems alongside non-Indigenous people in school leadership roles, planning and implementing innovative curriculum, and increasing the possibilities for partnerships built on a platform of mutual respect, resolve and responsibility from the outset (van Gelderen and Guthadjaka, 2019).

Premise 3: Enriching children’s development and learning from conception improves lifelong general health, well-being and learning outcomes

Research in numerous disciplines has contributed to our understanding of the critical importance of education and care in early childhood and the role that day-to-day interactions with caregivers plays in brain development from conception (Lally and Mangione, 2017; Shonkoff and Phillips, 2000). Studies in neuroscience, for example, have identified that the quality of the early caregiving environment has a significant influence on the way in which the brain develops (Glaser, 2014; Morgan et al., 2018). Studies in psychology have confirmed the importance of sensitive parenting and attachment security for children’s social and emotional development (Bergström et al., 2020; van der Voort et al., 2014), and psychology and education studies have shown that a complex range of both distal (income, parent education) and proximal factors (quality of the early home learning environment) impact on the acquisition and development of literacy skills (Mathers et al., 2014; Webb and Williams, 2018). A child’s home and parents, therefore, are viewed as the main agents of influence during the early years.

Longitudinal studies in the USA have demonstrated the benefit of education and care programs in early childhood that support families and children during the early years. In particular, the Chicago Child Parent Centers (Reynolds et al., 2010), the Abecedarian intensive early childhood development project (Campbell et al., 2002; Page et al., 2019), and the Perry Preschool Project (Belfield et al., 2006) have found that high-quality early childhood education and care programs result in a higher rate of high school completion and lower rates of juvenile arrest and school dropout. In addition, the Perry Preschool Project has recorded lasting effects through to age 40 on employment rates and earnings (Belfield et al., 2006) and, more recently, has reported positive inter-generational effects lifting multiple generations out of poverty (Heckman and Karapakula, 2019).

In economic terms, the lasting effects of quality early childhood education and care produce a high cost-benefit. Jenkins (2014), along with Heckman and Karapakula (2019), explained that the marginal program cost for an individual child has been found to be significantly less than the collateral benefits to society. This is achieved by minimizing future costs to society in addressing key issues, for example, delinquency and dropout, while at the same time increasing individual resources in the form of education and earnings (including the earnings of future generations). In response, governments worldwide are investing resources during early childhood to promote these long-term individual and societal returns (Bishop and Berryman, 2010; Jenkins, 2014). While the provision of quality early childhood education and care is an important consideration for all children, investment in this area is seen as a key mechanism for closing the equity gap between Indigenous and non-Indigenous Australians (Council of Australian Governments [COAG], 2009; El Sayed, 2018).

A 2014 review of early childhood parenting, education and health initiatives for Indigenous children and families in Australia (Bowes and Grace, 2014) found that most Indigenous early childhood research in these areas was descriptive and tended to focus on identifying and describing “gaps.” As a result, the collective research story has been seen as one of deficits within the Indigenous community. Similar to Canada (Preston et al., 2012), it appears the societal norms and values of the dominant, white, middle-class culture determine what constitutes quality and best practice in relation to childrearing and educative practices. However, Bowes and Grace (2014) pointed out that “the Indigenous experience in Australia is one marked by strength and resilience as much as by inequity and disadvantage” (p. 2). It is by harnessing the strength and resilience of Indigenous Australian families and communities and providing opportunities for them to determine the co-design and implementation of early childhood programs based on contextualized realities that the early learning of Indigenous children can be best supported.

Premise 4: An integrated service delivery approach to health and education supports children’s overall development, well-being and learning

A report on the findings from the study *Obstacles to Success*, conducted for the Australian Primary Principals Association (APPA) by O’Keeffe et al. (2012), cited insufficient out-of-school support for Indigenous children as one of the key obstacles to children’s

learning outcomes. The report discussed the need to strengthen family and community practices to ensure children feel safe and are fed, sheltered and given relevant health services. These affordances are seen to work well when they are wrapped around parental and community valuing and support of education. O’Keefe et al. (2012) identified that “absence from school, including low rates of daily attendance, lateness and high mobility, was reported to be a prime obstacle to learning by 72% of participants” (p. 39). Masters (2013) reinforced the need to improve Indigenous health and well-being of families, carers and communities in parallel with strategies to improve Indigenous children’s learning outcomes.

An holistic approach to the health, well-being and education of children recognizes that early life outcomes are complex and influenced by a wide range of factors. It considers children and families in the context of their communities and cultures and takes into account physical and mental health, emotional well-being and development. Such an approach can be realized through integrated service delivery that attends simultaneously to health, well-being and education (Bowes and Grace, 2014; Emerson et al., 2015). An integrated service delivery model can improve service responsiveness to family needs, reduce service fragmentation, and improve service continuity (Robinson et al., 2009; Ware, 2012). In an analysis of the Vulnerable and Disadvantaged Client Access Strategies, Robinson et al. (2012) found collaboration between service providers and the delivery of “wrap-around” services were particularly successful in engaging with families and providing multilayered support in disadvantaged communities.

Holistic programs and services, delivered using a strengths-based approach that recognizes and builds on the expertise of parents, along with programs that offer learning opportunities for parents, have been found to be even more successful (Emerson et al., 2015; Sims, 2011). Sims (2011) explained that such an approach requires non-Indigenous policymakers and service deliverers to clearly understand their assumptions based on experiences with non-Indigenous early education and encouraged them to set about becoming competent in Indigenous culture.

In a relevant Australian project, Priest et al. (2012) developed a conceptual framework which privileges Aboriginal knowledge of child health and well-being in an urban context. The holistic framework consists of four main themes: strong culture; strong child; strong environment; and strengths and challenges. Critical elements of an Aboriginal cultural perspective identified by participants were identity, being proud and strong, kinship and family connection, respect for Elders, connection to Country, connection to family, connection to community, ceremony, art and artifacts, and they avowed that none of these elements should be tokenistic or superficial.

While the findings of the study cannot be generalized due to the urban context, Priest et al. (2012) stated that the findings “resonate with recommendations from research and discussions regarding Indigenous health” (p. 191). They highlighted the need for deeper consideration of culture in policy and practices related to Aboriginal child health and well-being and strongly supported an holistic, integrated and strengths-based approach to service delivery. Similarly, a recent scoping review of published literature in Canada, Australia, New Zealand and the United States assessed the quality of the evidence base on family-centered interventions for Indigenous early childhood care and well-being. The authors of this review (McCalman et al., 2017) found family-centered care with integrated service delivery to be a positive approach, generating diverse healthcare outcomes for Indigenous children and their parents/caregivers. It would seem, therefore, that a coordinated and integrated service-delivery approach among government, community-controlled agencies, and health and education sectors is needed. However, such a model must foreground capacity-building in Aboriginal communities that is developed through consultation with and co-designed with communities.

Implications of the review: From premises to practice—reshaping Indigenous contexts through leadership for learning

Collectively, the four premises discussed above provide an evidence-based platform for challenging the status quo of what is historically an assimilationist approach to Indigenous education. Contemporary approaches to equitable and respectful family-school-community relations, when based on the four premises, can help to reshape the context in which Indigenous children the world over learn in school and in their homes and communities. However, moving from premises to practice requires a dedicated practical attention over the longer term. We propose two key interconnected areas for reform: leadership for learning and curriculum.

Leadership for learning

In combination, the four premises foster multiple opportunities for leadership for learning beyond the formal positions available to school staff. In particular, we refer to recent work that is applicable to facilitating leadership and agency of non-dominant and Indigenous family and community, parents and carers in supporting children’s learning inside and outside schools. Many engagement efforts by schools never succeed in achieving true partnership with parents/carers (Ishimaru et al., 2016). To overcome these barriers, the engagement process must be co-designed with all parties from the outset. This involves collectively establishing respectful ground rules of engagement and then living them throughout the inevitable ups and downs. Once the journey toward partnership commences, the school can no longer unilaterally change these ground rules (Arnstein, 1969).

These partnerships are like any relationship—an ongoing, negotiated process. In the words of one educator, partnerships are “about sharing and co-constructing the school together ... and once they (parents) have a voice, and you have to listen to that voice” (Auerbach, 2010, p. 728). This can result in extensive debate, disagreement and conflict between parents, between the school and parents and with the community more broadly as the enactment of the partnership is (re)negotiated (Auerbach, 2009; Epstein,

Fig. 1 Building blocks for authentic community-led engagement with schools.

2010). It is also important to recognize that engaging families and the community is a long-term undertaking involving a commitment to the mindset and process involved in shared leadership.

Fig. 1 breaks the engagement journey into broad stages, noting that individual communities and schools will progress at differing rates. The fundamental tasks involved in building such partnerships start with laying the foundations for engagement. The actions in this stage should be derived from first principles of participants and leaders—that the engagement of families, support for social justice and democratic participation are important because this is a moral imperative (Auerbach, 2009). Embedding these principles in symbolic and substantive ways will underpin all successive activities.

In the development stage, all parties co-develop the objectives and specifics of the engagement program. Building the participatory governance research, this stage will involve extensive discussion, deliberation and debate (Fung and Wright, 2001; Kania and Kramer, 2011). It is important at this stage to consider objectives of engagement that are broader than academic achievement for school children. For example, although improving children’s learning outcomes is the long-term aim, a focus on strengthening aspects of children’s health and well-being and Indigenous identity could well be the focus of a school-wide initiative in a remote Indigenous community. This broader perspective recognizes the school as part of the community and the potential for mutually beneficial engagement that extends beyond the classroom. In parallel to this, schools, Indigenous community groups and (grand)parents can explore where capacity to support greater engagement is needed and identify how this can be developed. It may, among many options, equally involve professional development for teachers to help them be “in relationship with and working alongside parents and families” (Pushor, 2012, p. 464) at childhood literacy workshops for parents (Riley and Webster, 2016; Saltmarsh et al., 2015).

The development stage and the subsequent implementation stage are recursive, reflecting the recognition that family-school-community engagement is iterative and ongoing. We argue that a more authentic measure of success involves a genuine attempt to value western and Indigenous ways of learning (Barr and Saltmarsh, 2014; Hanleybrown et al., 2012; Kania and Kramer, 2011; Yohani, 2013).

Curriculum

Closely linked to leadership for learning is the question of what counts as curriculum inside and outside Indigenous schools. A recent systematic literature review conducted by Harrison et al. (2019) found sharp contrasts between Indigenous and Western views of curriculum and learning. Whereas curriculum in the West is a body of knowledge that has been written and distributed by classroom teachers and by educational experts, Indigenous knowledge is learned through daily interaction with community “on country”.

In the main, Australian Indigenous children attend schools offering a Western national curriculum delivered in English which is not always the child’s first or perhaps even second language. Schools are led primarily by non-Indigenous principals and Indigenous staff are employed primarily in the role of teaching assistants to White qualified teachers. Although there are increasing efforts to incorporate Indigenous knowledges in the national Australian curriculum, the concepts of both-ways education are still in development.

Guenther et al. (2015) have critically examined what Aboriginal people from remote Australian cross-cultural communities thought about success in children’s education and how it might be achieved. Remote Indigenous Australian families reported three factors, linked to leadership for learning and curriculum, as integral to their children’s success in learning. First, high levels of importance are placed on family, school, and community engagement to support children’s learning. This factor emphasizes the empowerment of families to contribute to children’s learning inside school and at home: the importance of authentic partnerships where home knowledge is represented in the co-design of school curriculum. Second, is an urgent need for Indigenous teachers, especially local Aboriginal language teachers, to be equitably represented as permanent staff in community schools. Third, remote parents also

see the need for reflection and reform on the qualities of non-Indigenous teaching staff recruited from outside the community to work in remote schools. The qualities seen as key to successful teaching and learning included “flexibility, being friendly, kind, the teacher as a learner, being prepared for the environment, being respectful, patient, listening, passionate, having commitment and being dedicated to doing the best for the kids” (Guenther et al., 2015, p. 200). Underpinning these reforms is the implicit desire for a both-ways approach to learning that facilitates success in Indigenous and Western knowledge and identity.

Recent work by Bishop and Vass (2020) goes some way to explaining the disjunct between Western and Aboriginal thinking of “success” in terms of the cultural politics of Indigenous education. Culturally responsive approaches to curricula are not enough to make the difference that Indigenous people desire for their children. Bishop and Vass argue for the urgent need for systems change in the way teachers understand and work with Indigenous students and their families and communities. At the heart of the matter, pre-service and in-service teachers should be encouraged to question their ontology and axiology—that is, who they are and where they are from (Bishop and Durksen, 2020). In effect, no amount of curriculum reform using culturally responsive schooling approaches can make up for deficit approaches to pedagogy with Indigenous children and community.

In summary, changing the context in which Indigenous children learn at school and in their community is closely bound to the beliefs of school leaders, families and other stakeholders. Recognizing the need to deeply challenge deficit assumptions about the rights, responsibilities and capabilities of Indigenous school-families and communities as educators is paramount.

Limitations of the review

A significant limitation of the review is the high number of Australian studies utilized in it. However, we feel this is justified as the focus of this article relates to the Australian Indigenous context. Another limitation is the high proportion of qualitative studies included. We acknowledge that quantitative studies are important for gauging effect sizes; however, qualitative studies have helped us to understand the complex social issues from a variety of perspectives and to provide insight into these issues. As explained above, we have not tried to review all of the relevant literature in this paper. Instead, we have drawn out specific concepts that support/substantiate our premises. Yet, from the proportion of papers reviewed over a lengthy period, we are confident in the validity of the findings. While many of the findings may have implications for enhancing Indigenous children’s learning in other colonized countries, there is ready recognition that education policy and approaches to leadership and learning may differ across countries and regions.

Concluding comments

The momentum for changing Indigenous Australian policy and practice is growing (Dawson et al., 2020). Yet, responsibility for strengths-based change lies with us all through the sharing of new cultural frameworks and co-creating of equitable environments in which all forms of knowledge are valued, through a process of transculturation and shared leadership for learning. We argue that it is not just the effectiveness of Indigenous policy measures that needs to be refreshed: The way in which the problem is understood needs to be examined more critically.

The purpose of this article was to address the questions: “What works and why?” and “What does success look like from a variety of viewpoints?”. We focused this task on an Australian case study. However, a key message is that Australia’s Closing the Gap policy is a policy agenda that can be seen in other countries; therefore, the research and policy relevance of our four premises and two implications are applicable to the wider international education systems/context.

The four premises provide a means of critically examining some of the constraints engendered by Western colonial mindsets about Indigenous peoples’ rights and capabilities to be fully engaged in governance of their futures. Central to change for Indigenous children in particular is the need for a deep-seated shift by all Western systems, schools, families and communities from an entrenched deficit mindset about the rights and capabilities of Indigenous families and community to more positive territory. Strengths-based approaches and genuine engagement with Indigenous people may offer ways forward to provide policy measures that are based on Indigenous cultures and their people’s aspirations; how this will influence future Closing the Gap like strategies around the world is yet to be seen. It is clear that Indigenous Australian communities measure educational success as more than improvement in national literacy and numeracy scores sought at periodic times from primary to secondary schooling. We suspect this measure of success exists elsewhere.

Introduction

Schools in many countries across the world have undergone considerable reform over the past two decades and their principals have had to learn to manage increased volumes of government educational-policy initiatives designed to raise standards of teaching, learning, and academic outcomes for all students. Although these initiatives are seen by governments as a means of building human, economic, and social capital in increasingly competitive and socially turbulent global environments, there are continuing concerns over attempts by school leaders and teachers to implement them in ways that appear to be manifestly unlikely to work (e.g. [Payne, 2008](#); [Gu et al., 2021](#)).

It is perhaps then no surprise that many researchers and publications have explored the nature of educational reforms and their impact on schools and teachers over time. These, though rigorous in their approaches, tend to stress the negative consequences of reform on, for example, teacher morale, an increasing emphasis on the academic to the disadvantage of other humanistic areas of curriculum, and continuing problems of narrowing the achievement gap experienced by students from socio-economically disadvantaged communities. I, together with my fellow colleagues who have worked with and researched many passionate and inspiring teachers and school leaders over the last two decades, do not disagree with these generalities. They resonate with more general concerns about the ability of externally mandated reforms at system level ([Ainscow, 2015](#); [Elmore, 2004](#); [Fullan, 2016](#)) to provide a sustained impact upon the quality of teaching and learning and achievement without the active mediation of principals and teachers in the schools themselves (e.g. [Johnson, 2019](#); [Gu et al., 2020, 2021](#)).

However, an increasing body of research knowledge has identified improving and successful schools that do not compromise or sacrifice broader educational purposes, can beat the odds, and enable their teachers and students to achieve and thrive – both individually and collectively – in the face of considerable, continuing and at times, disruptive external policy demands ([Day et al., 2016](#); [Day and Leithwood, 2007](#); [Day et al., 2011](#); [Day and Gu, 2018](#); [Elmore, 2004, 2011](#); [Gu et al., 2016](#); [Leithwood, 2018](#); [Matthews et al., 2014](#)). The insight from such knowledge is that schools continuing to thrive in the reform process are “active agents” ([Hubbard et al., 2006](#), p. 14) who reshape policy initiatives into actions that are culturally, organizationally and educationally meaningful to their teachers and students in their daily realities. Put differently, how these schools respond to and do policy is “an act of co-construction” ([Hubbard et al., 2006](#), p. 14) and *enactment* in context, rather than *implementation* with fidelity.

The research upon which this chapter is based is about how successful principals lead their schools in times of intensive and pervasive policy reforms. The research does not, therefore, engage with the political and sociological debates about the pedagogical challenges, professional tensions, and ethical dilemmas that education policies and reforms have produced for school leaders and teachers (e.g., [Fuhrman, 1999](#); [Mitchell et al., 2011](#); [Payne, 2008](#)). Rather, we argue that the political, professional, and accountability pressures created by incoherent, disjointed, and at times contradictory external policy initiatives are part of the broad environments in which “schools and education policy subsist” ([Cohen et al., 2007](#), p. 526) in many systems including England, and within which schools in our research managed to continue to make a difference to students’ academic performance ([Gu et al., 2018](#)). Put simply, policy shifts have become unavoidable political realities of education in many systems. However, whilst some schools not only survive but also continue to thrive in the face of challenging and changing environments, others struggle and falter.

By using a longitudinal, mixed-methods design to investigate the interface of reform at macro (country), meso (school), and micro (classroom) levels, this UK research council funded three-year research investigated how government reforms (mandatory and non-mandatory) were received and mediated by principals and senior and middle leaders in improved and effective schools serving communities of contrasting socio-economic advantage. “Success” was defined as characterizing those schools that had shown sustained improvement in student academic outcomes over time (measured by pupil progress and attainment outcomes over a nine-year period), other key aspects of school improvement (measured by national inspection results), and reputation. In these successful schools, policies were conceptualized as “opportunities,” resources that leaders skilfully weaved into their processes of school improvement to create educationally equitable, and values-based “landscapes of success.”

Much of this research has been published in a special issue of *Leadership and Policy in Schools* (e.g. Day and Gu, 2018; Gu et al., 2018a,b). In this chapter I investigate, from the perspective of senior and middle leaders, the ways in which successful secondary principals in England had led their schools to achieve sustainable high performance in the face of intense reform efforts and policy shifts. Although the literature on successful principal leadership has become increasingly extensive over the last decade, knowledge about how key staff (i.e., senior and middle leaders in their schools) perceive the ways in which school principals make a difference to student outcomes tends to be limited. In particular, the literature has been relatively silent on how the key staff perceive the roles and practices of their principals in managing external policy demands and increased accountability pressures for sustained improvement over time.

Connecting leadership with policy enactment

Over the last 40 years, scholars have based their conceptualization of policy enactment and implementation on a range of critical sociological (Ball, 1994; Ball et al., 2012; Maguire et al., 2015), organizational (Elmore, 1995; Hubbard et al., 2006; Manning, 1982; Newmann, 1996), social psychological (Weick, 1979, 1995, 2005), and cognitive theories (e.g., Spillane et al., 2002; Spillane et al., 2002b). The critical sociological approach to examining how schools enact policy conceptualizes policy as text (Ball, 1994) in that it is “complexly encoded in sets of texts and various documents and it is also decoded in complex ways” (Braun et al., 2011, p. 586). Such a conceptual lens has allowed for an understanding of policy enactment as a creative, sophisticated, and complex process (Braun et al., 2010) in which “policies are interpreted and ‘translated’ by diverse policy actors in the school environment” (Ball, 1994, p. 19). Ball et al. (2012) argue that the enactment of policies is “an iterative process of making institutional texts and putting those texts into action” (2012, p. 45), and that enactment of policies is “always more than just implementation” because “they bring together contextual, historic and psychosocial dynamics into a relation with texts and imperatives to produce action and activities that are policy” (2012, p. 71). In their seminal research on how four “ordinary” coeducational, nondenominational, and nonselective secondary schools enact policy, Ball et al. (2012) observed that

At the center of policy enactment is the school—but the school is neither a simple nor a coherent entity, there is a need to understand schools as far more differentiated and loosely assembled than is often the case. Schools are not of a piece. They are precarious networks of different and overlapping groups of people, artefacts and practices. (2012, p. 144)

Indeed, the narrative accounts of how teachers and other adults from the four case-study schools interpreted, translated, and implemented various external policies in their own contexts of work showed that these policy actors are not only producers and consumer of policy, but also readers and writers of policy (Ball et al., 2011). This evidence highlights the localized and situated nature of policy actions (Braun et al., 2011). It also reveals that enacting policies in schools is a process of recontextualization in which policy actors work creatively in diverse ways to “fabricate and forge practices out of policy texts and policy ideas in the light of their situated realities” (Ball et al., 2012, p. 142).

Although writing from different theoretical perspectives to understand and explain how people in organizations and schools make sense of policies and implement them, Weick (1995, 2005) and Spillane (2004) have both emphasized the situated nature of sense making in the policy enactment process and the importance of considering how people make sense of their environments in this process. Thus, making sense of policies is not a passive process of decoding the information in the policy texts (Von Glasersfeld, 1989). Rather, in this process people as social agents “construct, rearrange, single out, demolish many objective features of their surroundings” (Weick, 1979, p. 164) and ultimately transform their environments (Spillane et al., 2002). Using the sense-making frame to examine how school leaders enact district-level accountability policies, Spillane et al. (2002) concluded that:

Managing in the middle in an era of accountability can also have advantages. Skillful school leaders can use accountability policies to augment their authority with respect to instruction... Hence, school leaders can interpret district accountability policies in ways that support their own reform agendas and use them to augment their influence over staff. Because the stakes are high, they can use district accountability measures to add considerable clout to their own efforts to transform practice in particular ways.

Spillane et al. (2002, p. 760).

The conceptual and empirical connections that Spillane and his colleagues have established between school leadership and policy enactment are important because schools’ responses to external policies are the result of the “function not only of leaders’

identities but also the multiple contexts in which their sense-making is situated" (2002, p. 755). They remind us that in schools, enacting policies is an organizational behavior which is crafted and shaped by school leaders, and principals especially, who set the directions of the school and can act to redesign the organization. How these leaders interpret and make sense, rationally and emotionally, of what a particular policy means to their schools and then decide "whether and how to ignore, adapt, or adopt" this policy locally (Spillane et al., 2002, p. 733) influences not only how the policy is interpreted by their teachers and how effectively it is implemented in the school, but importantly, the extent to which the actions of "enactment" are likely to disrupt, constrain, or advance further improvement of the school. In this sense, enactment links closely with the principal's role in their diagnosis of the school's needs and challenges and the focus on particular priorities in consequence. As our empirical research in this article shows, principals who do well know how to use policies as opportunities to create organizational conditions and regenerate school capacities for enhanced progress and performance which are not restricted only to academic attainment results.

In their analysis of how schools strategically manage multiple external demands, Honig and Hatch (2004) found that although some researchers argue that multiple policy demands in such environments strain schools' "ability to operate in coordinated and productive ways," others maintain that they may "add up to important new opportunities for school improvement" (Honig and Hatch, 2004, p. 16). By conceptualizing policy coherence as a dynamic and ongoing process, as opposed to an objective reality, they argue that schools are a central agent in crafting coherence between external demands and internal goals and strategies. In his earlier work, Hatch (2002) emphasized that schools are part of an ecosystem in which "many different entities are trying to co-exist" and in which "changes are constantly underway" (Hatch, 2002, p. 632). Honig and Hatch argue that "multiple external demands do not present a problem to be solved but an ongoing challenge to be managed, a potential opportunity for schools to increase necessary resources, and an important arena of organizational activity" (2004, p. 26–27). By extension, we argue that to create and embed coherence between policy and practice within the particular context of a school's organization requires strong leadership. We ascribe to the view of the superintendent in Hubbard et al.'s (2006) research on how schools learn from reforms that "coherence making at the end is what leadership is about" (2006, p. 157).

The research

The chapter draws upon empirical evidence from a UK Economic and Social Research Council (ESRC) and HK Research Grants Council (RGC) jointly funded bilateral project (ES/J017035/1) on how "successful" secondary schools in England and Hong Kong mediate government policies in furthering their own broad improvement agendas. The primary purpose of this research was to advance understandings of how mandated government reforms were mediated by principals, senior and middle leaders, and teachers in improved and effective schools which served communities of contrasting socioeconomic advantage. The research was guided by three broad questions:

- (1) How do leaders in successful secondary schools across different contexts respond to government systemic reforms?
- (2) What key challenges and issues do they face in sustaining academic standards for all whilst forwarding their broader educational success agendas?
- (3) How and to what extent do school leaders at all levels in these schools maintain a strategic and operational focus on the leadership of learning and teaching whilst managing wider structural and cultural changes?

The research began with a mapping exercise of the perceived challenges of current government reforms in Hong Kong and England and a secondary analysis of two existing national surveys on senior and middle leaders' perceptions of their principals' contribution to change and improvement in their schools. These surveys were part of two parallel three-year research projects led by the research teams which investigated the impact of school leadership on the improvement of students' academic and social outcomes in the wider educational reform contexts in Hong Kong and England, respectively (Day et al., 2011; Gu et al., 2008; Walker, 2011). By merging the datasets of the two surveys and taking into account contextual differences, this secondary analysis sought to develop an evidence-based model to analyze the influence of leadership at all levels on the implementation of systemic reform on the structures, processes, and outcomes of school and classroom improvement.

These analyses formed the basis for case studies of eight improved and effective secondary schools (four from the parallel study in each country) across diversified school populations in different socioeconomic contexts. A purposive sample of four secondary schools in each country was selected using the following criteria:

- (1) *School performance*: "improved" and "effective" schools. All schools were selected from the research samples of two parallel large-scale research projects on school leadership and change. The parallel studies involved ten secondary case-study schools across different contexts in England and Hong Kong respectively. Four from each country, which had shown significant improvement or higher than average improvement in their value-added scores in English (in England)/Chinese (in Hong Kong) and mathematics over the three-year period prior to the commencement of the projects, were invited to participate in the research.
- (2) *School contexts*: The indicator of free school meal bands in England and the indicators of the medium of instruction and school sponsoring body in Hong Kong were used to select four schools which serve communities of contrasting socioeconomic advantage/disadvantage.
- (3) *School size*: Ranging from small to large.

The main methodological advantage of studying these schools was that we were able to build rich, longitudinal accounts (2005–2014) of their values, strategies, and practices and thus ensure an in-depth investigation of this new research area. The case studies focused upon the ways in which reforms were mediated by principals and senior and middle leaders and teachers in order to assess the extent to which the primary intentions had been translated into practice and sustained and if not, why not. This helped us better understand the dynamics underpinning the effectiveness of the models of government reforms in England and Hong Kong and provide school-level, evidence-based analytical insights into the processes by which reforms were enacted.

Case studies of four secondary schools in England

The qualitative strand used four in-depth case studies of a subset of the original 10 secondary case study schools in the IMPACT study (Day et al., 2011). These four cases, together with the four in Hong Kong, were selected to enable in-depth, longitudinal analyses of leadership and change. All four schools showed significant improvement or higher than average in their value-added scores in English and mathematics at Key Stage 4 (age 16) in public GCSE examinations over the seven-year period prior to the commencement of this research (including the three years prior to the beginning of the IMPACT project). These case studies represented schools in different levels of socioeconomic advantage and disadvantage (as measured through the low-income indicator percentage of student intake eligible for Free School Meals) and ethnic diversity.

Data were collected through two visits over a two-year period with detailed interviews of principals and a range of key staff and stakeholders. The main methodological advantage of studying these schools was that we were able to build on and extend existing datasets from the IMPACT study (2005–2009) and thus achieve longitudinal narrative and reflective accounts of the challenges, processes, and outcomes of change and improvement that schools had experienced in mediating externally imposed structural and curriculum reforms across a period of nine years (2005–2014). By focusing on “success” (i.e., schools that had shown sustained improvement in academic performance over time and also were judged as Good or Outstanding by national inspections), we were able to identify effective principles and practices of leadership and educational practice for change and improvement in schools and classrooms. Through these, we extended our knowledge of how and to what extent some school leaders and teachers successfully mediate government models of systemic reform whilst maintaining the broad educational purposes of learning and teaching in their places of work.

Although this chapter focuses on case studies from England only, research findings from England and Hong Kong are broadly consistent in suggesting that school organizations are adaptive social systems in which school improvement must be understood both in contexts of policy enactment, contexts of use, and in connection with the values and capabilities of the principals and staff at all levels of the systems (Day and Gu, 2018). This is despite the differences in national cultures and education systems between England and Hong Kong in our research. In his postscript of our special issue, Leithwood (2018) concludes that ‘policy-driven school reform depends critically on school leaders’ responses to external policy initiatives’ (2018, p. 392):

The mediated effects on students of a set of practices commonly enacted by successful leaders in widely different contexts certainly count as an important finding but is not novel enough to count as an insight. What does count as an insight is that these same sets of practices may be successful in accomplishing a wide array of outcomes for students. ... Leaders sampled by the four articles were initially selected because they had been successful in helping their students achieve those “tool skills” measured by external government tests, among other things. But these principals and their staffs had more ambitious and varied goals for their students such as, for example, internationalism, entrepreneurialism, creativity, and more. (2018, p. 394)

Findings: how senior and middle leaders see their principals enact education policy for sustained improvement building capacity: using policy as impetus for change

The four case-study schools served communities of contrasting socioeconomic disadvantage and were led by principals with different years of experience in the school. However, despite differences in context and leadership history, what shone through the interviews with senior and middle leaders in all four schools was a strong, collective sense of positive leadership which embraced external policies and innovations as the catalyst for further growth and higher performance.

For the purpose of this chapter, I have selected a story of a secondary school that provides an example of how the principal led an already successful school to even higher performance. This principal had the shortest tenure of all the principals in this research, having only been in post for three years when the first data were collected. Her values and vision for excellence were perceived by senior and middle leadership as the key drivers for change. Shaw Lane was inspected within a term of her appointment and was judged to be a “Good” school. Since then, she had made considerable progress in addressing the areas of weakness the inspection had highlighted, most notably the teaching and learning agenda which had been radically overhauled via a range of strategies to foster more collaboration and creativity amongst teachers. We interviewed seven senior and middle leaders in the school and most were interviewed twice over this two-year project. This example is used to illustrate that for principals in our case studies, the key to success in enacting external policy demands is to use them as opportunities to develop and transform people—such that they share the same values and passion for further growth and development, and that they become change actors (as opposed to receptors) who possess enhanced knowledge, qualities, and capacity to regenerate the social and intellectual culture of the school, and importantly, to manage new changes, collectively and collaboratively, for unified goals and core purposes.

The Shaw Lane girls academy: from good to outstanding

The contexts

Shaw Lane, a single-sex school situated on the outskirts of a large urban area within the Midlands region of England, was a relatively small secondary school and sixth form that provided an education for approximately 800 students between the ages of 11–19. The school served a culturally homogenous population with the majority of students from a non-White heritage background and many speaking English as an additional language. The number of students eligible for free school meals was higher than the national average (46% vs. 13%), as was the proportion with a special educational need (75.9% vs. 16.2%) at the time the study was conducted.

The school was judged to be a Good school by the Office for Standards in Education (Ofsted) shortly after the principal's appointment in 2011. The inspection report drew attention to the good progress made by all students and the high-quality teaching and learning that took place across the school. It also highlighted the positive impact of the recently appointed principal within the context of the "legacy of underperformance" she inherited from her predecessor. By 2014, the school achieved an overall grade of Outstanding.

During this critical period of school improvement and renewal (2011–2014), four major new government initiatives were introduced to schools in England, reflecting a change of government in 2010—all of which demanded deep structural, financial, and cultural changes: performance-related pay and appraisal (Department for Education, 2013); a new Ofsted inspection framework; a review of the National Curriculum and change in the way school performance was measured; and pressure for the academization of all schools (which are funded by the Department for Education but independent of local-authority control). The principal's aspiration for Outstanding was proudly shared by her staff as a "powerful" aim and morally just vision for the school (Assistant Principal). Driven by such an aspiration, she used the enactment of these various external policies as an opportunity to raise expectations and anchor core values; to consolidate consultation and enhance ownership of change; and, above all, to build, broaden, and deepen the capacity required to lead further change and improvement.

Opportunity of purpose: anchoring core values

Deal and Peterson (2009) argue that "Central to successful schools is a powerful sense of purpose that is focused on students and learning" (2009, p. 250). Shaw Lane was no exception. All the senior and middle leaders reported that the school positioned itself ahead of educational policy and that they were cautious of being too reactive toward government reform. Managing change was seen pragmatically as the nature of the job: "When a policy comes in—if it's statutory—then it's got to be done" (Head of Mathematics). Because government policy initiatives were, more often than not, unpredictable and potentially transient in nature (seen as likely to shift with a change of government), it was believed that the priorities of the school had to be centered on moral purpose, upon doing:

...what is right for the students because if you do what is right for the students then you must be doing the right thing. ... At the end of the day, if you look at government policy it comes and it goes, doesn't it? But the needs of the students don't change that much; they might change in terms of the contexts they have but, fundamentally, what you're trying to do is to prepare them for a future in which they can be useful citizens.

Senior Deputy Principal.

Such moral compass defined a shared direction for the school and a strong commitment in the staff who wanted to move the school forward "to be more than Outstanding: making sure that whatever we are doing is for the benefit of the students" (Middle Leader—Humanities). What also came across consistently and powerfully here was how the shared purpose and direction had run deep to shape a confident attitude toward change and policy demands. Student needs rather than government priorities informed the way that the school was organized and operated:

I don't feel shackled by policy because I've got a lot of experience behind me and [the principal] wants Outstanding and so she is putting structures into place to achieve that; and that is why I don't feel shackled by it because if you are doing your job right then you have nothing to worry about. And we share a similar ethos which is about producing well-formed individuals and it's about us finding the best way for these girls in Shaw Lane to achieve and to be well-formed individuals. So [the principal] will do that her way.

Assistant Principal.

Associated with this positive mindset of change was a sense of positive, assertive, and responsible professionalism in the school. The ethical principles and standards that acted as drivers for improvement were to "do your best every time a student comes through" because "every student who comes to this school has only one chance" (Senior Deputy Principal). Importantly, these standards were defined, believed in, and pursued by the staff, manifesting themselves in the form of what Elmore (2003) calls "internal accountability":

At the end of the day, what you are trying to achieve for the students is the best possible exam results and qualifications that are going to enable them to go on and be successful in the future; and you want the students to have the qualities and the characteristics which will enable them to be productive citizens when they leave here. If you can do all of that then whatever accountability framework comes along it should meet it, shouldn't it? If you're doing what is right for the student, then it should meet whatever framework does come along.

Senior Deputy Principal.

Opportunity of ownership: communication and consultation

The principal and her senior leadership team created clear lines of communication to ensure that staff members were thoroughly consulted and well informed about the policymaking process at school. They were given ample opportunity to air their views on the ways in which the latest policy initiative would affect them and their work. This process, driven by the principal's insistence on communication and transparency, also ensured that staff members fully understood the policy in question and that they were given time to negotiate how it would be enacted on the ground in their departments and classrooms:

Mostly the senior team is very good and they will consult with middle management and we have a group set up where we will meet up at lunchtimes or after-school sessions where, if the senior team have got certain policies that they are going to implement, they will take our views on board before they implement the policy. So, there is that going on and we, as heads of department, meet regularly with the senior team and, of course, those issues are discussed there as well and heads of department will get a chance to have their say as well. So that level of communication will go on before that policy is actually put into practice, so it's not something that has just been sprung on us and there is a certain amount of discussion and communication that goes on beforehand.

Head of Mathematics Department.

There was also a forum for departmental heads to discuss the implications of policy changes through their monthly curriculum meetings before returning to their respective faculties to feedback these discussions to their teaching staff and consult them on any changes that might have been proposed. The following senior leader explained how the organizational structure had facilitated communication and the sharing of information, which helped them to manage change in practice:

ICT is no longer a topic in itself—it's changed to computer science—and we were looking at that yesterday and whether we can do an ICT audit across our curriculum because every subject is responsible for teaching ICT. This is what the government is saying and we need to adjust to these changes. So, it's in curriculum meetings and it's in faculty meetings as well because when we go back we discuss it as a faculty on the necessary changes that are taking place. Even the changes in the courses for GCSE now are fed down from senior management and then passed through so that everyone is aware of what is going on across the school.

Acting Deputy Principal.

It is perhaps, then, no surprise that a strong sense of ownership and collective loyalty was shared in the school. This was seen as a sign of an open, cohesive, and trusting culture that the principal and her senior leadership team had regenerated. Shaw Lane was described by middle leaders in particular as a "happy place" where staff were treated well (Head of Humanities) and "a listening school" where "I've got a voice": "You've got the freedom to say what you are happy with and what you feel might need to be improved" (Head of English). Making policies was regarded as "a whole-school thing" (Head of Humanities), as the decision-making process involved open discussions with staff members at every level in a very democratic way. As a result, there was a high level of consistency in behavior across the school: "Policies we have integrated are whole school policies. It's almost like nobody deviates from the norm and we are all doing the same thing: the marking policy is the same; the data collection is the same; behavior policy is the same" (Head of Humanities). Such consistency in behavior and vision helped to deepen the coherent and cohesive culture in the school, which made further growth and improvement possible.

Opportunity for capacity building: Focusing on the basics Improving teaching and learning was seen as "the bread and butter of what we do" (Assistant Principal), and was believed to be "a positive drive" (Head of Music) that had turned the school around:

That is all about capacity building and it's all about developing the staff to have the skills and knowledge that they need and that is obviously going to feed through to the students and lead to them getting a better experience.

Senior Deputy Principal.

Put simply, to embrace change effectively in the school required capacity building. Key in this regard was quality professional development. This was because, at least in part, the policy "is actually saying that this is the direction that we think you ought to go, and this is the sort of path we want you to take. But how you walk along the path—'how the garden grows'—is actually up to you" (Senior Deputy Principal). Thus, knowing how to make sense of external policy and recontextualize it in ways that were fit for purpose required sustained attention to improve the knowledge, skills, and practices of the staff on the ground.

The newly introduced Ofsted inspection framework, for example, was used as a vehicle to raise the standards of provision of teaching and learning in the school. This was achieved through the provision of a series of in-house training events designed to ensure that the staff had a thorough grasp of this framework. At the same time, there was an “Open Door Community” (Assistant Principal) in the school where the staff felt “safe” to share practice and discuss what outstanding teaching and learning looked like. After some initial worries, the Head of Humanities realized that the new framework had not really had much impact on her “because our lessons are well-planned and we are well-resourced anyway.”

Similarly, when enacting the new performance-related pay and appraisal policy in the school, efforts had been focused on how this policy could be used to join up with support for learning and development, and through this, foster a professional culture of high expectations.

We’ve also looked at the idea that performance management is something that underpins what happens throughout the whole school. So your performance management should be tied to your CPD and your school development plan, and so every department, having identified what the department needs are to fit in with the whole school development plan, is able to create a training plan for the department and, therefore, the CPD will actually support individual staff in specific CPD that will help them meet department needs, their own needs, and whole-school needs.

Senior Deputy Principal.

The leadership intention was well-received by their middle leaders: “they’ve [Senior Leadership Team] really pushed the idea that performance management is not a whip for us to be beaten with and it’s meant to be about self-development” (Assistant Principal). The quote from the Head of Mathematics below expressed a similar view, which represented not only a common voice from the interviews, but also, and importantly, a testimony to the success of the principal leadership in that she had shaped a high degree of consistency in values, expectations, and behavior across the school.

I think colleagues understand the need for accountability. You would think that there are very few colleagues who are in that position where they are bordering on being incompetent, if you like. The majority are hardworking and conscientious people who want to do right by the kids. So, the idea of the appraisal system is to support them to improve and it’s just about evidencing what you do day in and day out. That’s what needs to happen really: it’s finding out the people who are perhaps dragging their heels and making them more aware and more accountable and getting them to perform to their best.

Head of Mathematics.

Discussion and conclusion

A central concern of this research was to explore whether, and in what ways, various senior and middle leaders had a consistent understanding of how their school principals purposefully incorporated and embedded, rather than were passively led by, external policy demands in sustaining school improvement and growth in student learning over time. The findings of the research led to two observations.

The first observation is about principal leadership. Evidence from our research suggests that building internal school capacity for improvement is not a simple, linear process. It requires directions from inspiring and visionary school leadership to create, develop, and sustain coherent and fit-for-purpose structures, cultures, and conditions to grow the knowledge, skills, and commitment of individuals and harness them to become the collective capacity of the school. This observation confirms what we already know from the research literature on successful school leadership: shared directions and goals and consistency in understandings of the standards of teaching and learning are key characteristics of high-performing schools where fundamental principles and values unite and drive teachers and leaders to be intellectually and emotionally committed to make a positive difference to the lives of their students (Day et al., 2011; Drysdale and Gurr, 2011; Gu et al., 2014; Klar and Brewer, 2013; Leithwood et al., 2006, 2010; Sun and Leithwood, 2015).

Investigating how successful principals had managed external policy demands from the perspectives of their key staff enabled us to learn more about leadership and change. In high-performing schools a key defining aspect of principal leadership is an unrelenting focus on fostering consistent values, expectations, and standards, and through these, empowering and transforming staff capacities and organizational conditions to embrace change and improvement. A growing body of research on senior and middle-level leaders, albeit limited, has shown the importance of their roles in influencing decision making, supporting the professional development of their peers, promoting shared vision and high expectations, developing a culture of shared responsibility and trust, and fostering collaboration at different levels within and across the school (Cranston, 2009; Dinham, 2007; Gurr and Drysdale, 2013; Leithwood and Riehl, 2005; Shaked and Schechter, 2018; Wenner and Campbell, 2017). Put succinctly, senior and middle-level leaders hold a key position in schools’ efforts to manage change, embed innovation, and sustain improvement. However, the extent to which they are able to fulfill their leadership roles and responsibilities effectively and consistently is influenced, directly and profoundly, by the leadership values, qualities, and practices of their principals (Day et al., 2011; Gurr and Drysdale, 2013).

In this research, the marked similarities between the principal and key-staff SEM models (Gu et al., 2018a), together with the narrative accounts from the case-study examples, highlight—most powerfully—that establishing consistency and coherence in

school structures, cultures, and improvement processes holds the key to engaging the heads, hearts and hands of the school community to achieve sustained and sustainable performance over time. Such consistency and coherence were reflected in understandings—between those who led and those who were led—of how and why their schools were able to become successful and, as importantly, to stay successful. They helped to shape the day-to-day practice of school life and enabled schools in our research to remain focused on the core business of schools – quality provision of teaching and learning – irrespective of external pressures of change.

The second observation is about how successful principals respond to, manage, and enact external policy demands. We found that in successful schools the process of policy enactment and the process of school improvement are not two separate processes. They are intertwined to form one overall process in which external policy initiatives and internal school improvement practices are purposefully aligned by principals to serve their moral purposes, educational values, and goals for the school. At the heart of this intertwined process are continuous leadership efforts to support collaborative professional learning and development and, through this, to build the necessary whole-school capacity for sustainable personal, social, and academic improvement in student outcomes. Investigating how school principals shape their school's improvement efforts from the perspectives of middle and senior leaders provides us with more insightful evidence on how and why some schools have the capacity to manage change, despite facing the same external challenges and demands, whilst others do not.

In summary, policy enactment is, in essence, about change. External policy initiatives—whether they are foreground or background noises that schools can or cannot ignore—represent some, but not all, of the many demands, challenges, and opportunities that schools face in their everyday working worlds. Enacting policy successfully essentially relies on building and consolidating the capacity for further growth and development. Key in this regard are strong leaders who know how to design the social and intellectual conditions which engage the heart and mind of individuals in the school and, through this, harness their ideas, experiences, knowledge, and relationships to fulfill shared values and achieve shared goals. Kotter (1996) argues that although managing change is challenging, the much better challenge for most organizations is “leading change” (1996, p. 30). Evidence from our research shows that in successful schools, what the leaders appear to be doing exceptionally well is using policies and reforms as opportunities for change—purposefully, progressively, and strategically—to regenerate collaborative and coherent cultures and conditions which encourage and support the staff to learn, to reflect, and to renew their practice.

Introduction

Leadership remains a critical determinant of performance within and across organizations, including schools (Leithwood et al., 2020). While often indirect, the impact of principals' leadership on various indicators of organizational capacity and performance is significant (Kulophas and Hallinger, 2020). In this context, attention internationally has focused on developing successful principals through high quality leadership development programs (Barnett and Okilwa, 2020). Research has documented core

attributes of high-quality programs that best prepare aspiring principals for the job ahead (e.g., Darling-Hammond et al., 2010; Slater et al., 2018). Our previous research found that high-performing leader development programs, despite operating in different countries, seem to share certain core designs, structures and practices (Walker et al., 2013). Yet they can be differentiated jurisdictionally based on governments' policy intentions (Bryant et al., 2012). However research has not investigated how specific programs adapt or remain stagnant over time in response to changing contexts. Addressing this can provide clues as to how leader development programs retain currency to meet the needs of aspiring educational leaders and school systems. Therefore, the purpose of this article is to assess how five high-quality leader development programs in different Asian and Western jurisdictions compare in three key design domains and how they change over time in response to shifting system environments. We are guided by four research questions:

- Are there any common or different *frameworks* which bind leadership development programs with related leadership functions or local conditions?
- What major *content areas* are delivered through the programs?
- How are programs *operationalized* in terms of provider expertise, formal credentials, and selection?
- How and why have preparation programs evolved in the above design domains over the last decade?

Through considering these questions we suggest implications for program development and identify major directions that principal preparation programs have and are taking to meet the complex needs of principals (Normore and Lahera, 2019).

In this article we examine developments in principle preparation internationally over the last decade by first recounting our previously published analyses on the state of principal preparation programs across five countries in 2011 (Walker et al., 2011; also see Walker et al., 2013; Bryant et al., 2012). We do this in each section of the article by extracting segments of verbatim text from our original manuscript (Walker et al., 2013), followed by updates with new analyses of current data (predominantly policy papers and program documents) for the programs. As such, we include discussion of how and why the structure and practices of leader development have changed in each jurisdiction, track their trajectories over the last decade and suggest issues for consideration going forward.

In order to expand understanding of leadership preparation across the five different national contexts we first present relevant literature reviewed in our original paper (Walker et al., 2013) with a brief update in order to provide an analytic framework to compare programs. We then recount methodological decisions including site selection, data collection, and analysis. Next, we delineate the major features of the selected programs and then analyze program commonalities and variations. We also discuss in a new section emerging trajectories and their possible implications for the programs.

Literature

Over the last 20 years, school principals' work has increased in complexity in response to wide-ranging reforms such as the coupling of school-based management with accountability measures (Cheng, 2009; Lee et al., 2012a; Walker and Ko, 2011), standardized testing (Carnoy and Loeb, 2002), and the use of data related to student learning outcomes to drive school improvement (Lee et al., 2012b). The pressures of implementing such changes in schools, the skills needed to make them work and the time commitments required has resulted in many potential leaders electing not to enter the principalship (MacBeath, 2011; Walker and Kwan, 2010). In Asian societies, such as Hong Kong and Singapore, this problem is not evident (Walker and Dimmock, 2006). Nevertheless, the bulk of recent research on leadership preparation has been conducted in western societies.

Within this context, preparing effective school leaders has been placed at the core of many educational reform agendas (Bryant et al., 2012) and has been the subject of much research. Indeed, recent studies have focused on indicators of effectiveness of high-quality leadership programs. For example, Darling-Hammond et al. (2010) studied eight pre-service principal training programs in the United States. These were selected because of the strength of their outcomes. Despite varied approaches, the following features were embedded in each:

- The alignment of a coherent curriculum with externally developed state and/or professional standards;
- An emphasis on instructional leadership and school improvement to guide the program philosophy and curriculum;
- The use of active and student-centered learning strategies;
- A teaching faculty that includes practitioners and scholars who are experts in their fields;
- Diverse support structures such as formal mentoring systems and cohorts;
- A rigorous approach to participant selection;
- Supervised internships or school attachments.

Consistent with these indicators, the overall trajectory of leadership preparation programs has converged across different societies. Based on our previous work (Walker et al., 2011), we particularly note this convergence in terms of three interdependent components of leadership programs—i.e., framework, content, and operation.

With the increasing global emphasis on accountability, states or professional associations frequently mandate leadership frameworks that are centrally defined and aligned to district or state level educational policies (Bryant et al., 2012). Within jurisdictions, various providers may be endorsed to deliver leadership programs that meet the requirements stipulated in the frameworks.

Although conducted mostly in western countries, previous research suggests a high level of commonality in the content of contemporary leadership development programs. For example, Bush and Jackson's (2002) found a shared emphasis on

organizational, transformational and instructional leadership as well as traditional content areas such as “professional development, finance, curriculum, and external relations” (p. 421).

A body of research also shows that common features embedded in leadership programs include the engagement of participants in the field through experiences such as internships or university-district partnerships (e.g., Darling-Hammond et al., 2010). Both tactics aim to address the provision of authentic leadership experiences for program participants. The internship serves to contextualize skills that are otherwise explored through simulations, case studies, and problem-based learning, learning strategies that fall short of “the same urgency, sense of responsibility, and discomfort” (Perez et al., 2011: 218–9) encountered in the principalship. In such programs, field experiences form the “centerpiece” of authentic development.

Another notable common feature is participation in action-oriented projects and experiential project-based learning that allow application of learning in real-world contexts. Findings by Piggot-Irvine (2011) suggest that for such approaches to be effective they require careful delineation of scope, time constraints and support from academic staff and/or mentors. This suggests that leadership projects would benefit from being coupled with extended periods in the field and well-developed mentorship structures. In sum, programs previously conducted in university classrooms only now include school-based leadership development that emphasizes learning through practice in context (Piggot-Irvine, 2011).

Darling-Hammond et al. (2010) suggest that excellent leadership programs demonstrate positive relationships between universities and districts. More specifically, Sanzo et al. (2011) report that when courses are taught in an integrated fashion involving university faculty and district leadership, participants seemed more able to connect theory to practice.

Many of the above developments reflect a swing toward learning through practice. This development has been reinforced in many countries by the involvement of professional associations, unions and nongovernmental agencies as program providers—alone or in partnership with universities—and/or as contributors to state leadership frameworks (Bryant et al., 2012; MacBeath, 2011).

All these features illustrate a degree of convergence in terms of the operational features in current leadership preparation programs; however, differing district and national contexts impact on their operation (Leithwood and Levin, 2008). Operationalizing leadership programs seems to be inextricably intertwined with local needs. Thus, whereas contemporary leadership programs employ similar features in terms of framework and content, state goals and local needs significantly impact on enactment (Bryant et al., 2012). Given that most previous research targeted western-based leadership programs, we believe that a joint focus on both western and eastern societies may better help identify variations. For instance, systems such as Hong Kong and Singapore, which perform at the high end of international school outcome measures and retain examination-oriented cultures, may honor differing values to inform leadership preparation. We believe that capturing both commonality and variations in quality leadership programs will provide a fuller picture for school leadership program developers and policy makers. This perspective sets the scene of our inquiry.

Further development

More recently, preparing effective school leaders has been placed at the core of many educational reform agendas in both developing and developed countries. Leader development research has focused on reviewing preparation programs in specific regions or countries (e.g., Devi and Fernandes, 2019; Gurm, 2020), evaluating and suggesting frameworks for designing programs (e.g., Normore and Lahera, 2019; Okoko, 2020); and comparing preparation programs within or across continents and systems (Barnett and Okilwa, 2020; Eacott and Asuga, 2014). However, there remains limited probing of synergies around government policy, local context, service brokers/providers, and program structures.

Methodology

In this section, we first relate verbatim the major thrust of our original 2011 methodology (Walker et al., 2013) and then explain our approach to updating the analysis.

Site selection

For the purposes of this study, we identified five principal preparation programs from five different societies for analysis: Australia, Canada, Hong Kong, Singapore, and the United States. Given our aim to draw international comparisons in leadership preparation, selection criteria addressed congruence around indicators of excellence and diversity of context.

At the state level, each of the selected programs is located in jurisdictions reported as top performers in the Program for International Student Assessment (PISA). We recognize that PISA results do not evidence a direct relationship to leadership preparation. However, PISA results are closely followed by policymakers, stimulate international competition, and legitimate reform efforts (Afonso and Costa, 2009; Rautalin and Alasuutari, 2009). High performing societies become magnets of interest for researchers and policymakers looking for strategies to improve their own educational systems (Phillips and Ochs, 2003). Accordingly, performance on PISA is recognized in consultancy reports (c.f. Barber et al., 2010), policy papers (c.f. National Governors Association and Council of Chief State School Officers and Achieve Inc., 2008) and academic research (c.f. Matthews et al., 2008) on school leadership, and informs our selection. Each of the jurisdictions selected for study performs in the top 10 of PISA measures. Further, the selected programs are offered in jurisdictions identified for excellence in educational leadership (Barber et al., 2010). Given the diverse performance on PISA that is found within large federations such as the United States and Canada, this helped to narrow our selection (e.g., to specify New York and Ontario).

At the program level, selection criteria used recently delineated research-based indicators of exemplary leadership programs with high performance outcomes (Darling-Hammond et al., 2010). These include alignment to “state and professional standards”, an emphasis on “instructional leadership and school improvement”, student-centered learning, knowledgeable faculty, cohort structures, “formalized mentoring and advisement”, rigorous participant selection, and site-based internships (Darling-Hammond et al., 2010: 181–2). Although the selected programs share such features, commonalities and variations in their development, employment and emphases need to be further understood. Selecting programs with broadly shared features allow for a more fine-grained analysis of similarities and distinctives.

Each program leads to a credential accredited by regulatory agencies or universities. We exempted Victoria, Australia from this final selection criterion in order to meet selection criteria for the diversity necessary to obtain an international perspective on principal preparation in high performing educational systems. We note that of the top ranked PISA performers, most do not have required pre-services preparation programs, which eliminated countries such as Finland, New Zealand and the Netherlands from our selection.

Finally, we limited our study to systems that operate leadership programs in the medium of English. This served practically to assist in data collection and analysis as the selected systems had documents in English which were publicly available on the Internet or by request.

Sources and data collection

The data set comprises reviews of program evaluation reports, in-house materials such as syllabi, and Internet searches. Each of the researchers initially explored different programs, contacted key personnel, searched the Internet, and uncovered academic papers and internal documents related to the specific programs. While Internet data often provided the general structure of programs, the evaluation reports, program guidelines and interviews served to tease out key or unique features of each (See Walker et al., 2013 for sources in addition to those provided in the reference list).

Analytic strategies

We devised a comparative analytic framework based on our review of extant literature. Leithwood and Levin’s (2008) leadership development typology informed the initial draft of the framework. Leithwood and Levin (2008) observe a lack of a comprehensive leadership typology. Accordingly, through a literature review, we identified other facets of leadership preparation programs and wrote descriptors of each in order to build a broader analytic typology. [The full typology and details of its development can be found in the original article (see Appendix 2 in Walker et al., 2013)]. While we used these to code programs, given that our purpose aimed for comparison we used a constant comparative approach (Corbin and Strauss, 2008) to identify content common across the five programs.

Nearer to the end of our analysis we arranged the codes under five broad themes: purpose, framework, content, delivery and operational features. However, in this paper we limit our discussion to the three themes that emerged as most significant and inter-related¹: framework, content and operational features. We report updates to these design domains as applicable.

Developing trajectories

In order to assess developments over time, we decided to analyze the current state of the original five leader development programs while recognizing possible debate about whether or not they may still be classified as exemplary. To do this, we collected current policy documents, leadership frameworks, and program designs found on government and program provider websites. We assessed change as represented in these documents in the framework, content and operational features domains.

Program profiles, contexts and frameworks

In this section, we outline key features of the selected programs, including their evolution over the decade since our initial analysis (Walker et al., 2013).

Canada (Ontario): principals qualification program (PQP)

In Canada, Ontario has long mandated a pre-service qualification for entry into the principalship, termed the Principals Qualification Program (PQP). The PQP is regulated by the Ontario College of Teachers (OCT), which mandates program expectations, content requirements and learning outcomes. The OCT also accredits providers, which include universities and professional associations (Ontario College of Teachers, 2011). The OCT’s guidelines in turn cohere to the Ontario Leadership Framework, developed by the Institute for Education Leadership (IEL, 2008), which cites Leithwood et al. (2006) influential research synthesis as providing

¹Discussion of other categories may be found in Bryant et al. (2012), and Walker et al. (2011).

Table 1 Changes to the Ontario leadership frameworks.

2008 OLF (IEL, 2008)	2012 OLF (Leithwood, 2012)
Setting directions	Setting directions
Developing people	Building relationships and developing people
Redesigning the organization	Developing the organization to support desired practices
Managing the instructional program	Improving the instructional program
Securing accountability	Securing accountability

its theoretical foundation. These informed four of the framework's leadership domains with a fifth emerging from the province's accountability requirements (IEL, 2008) (see column one of [Table 1](#)).

The framework also informs various other facets of leader development, including mentoring ([Ontario, 2010a](#)), and performance appraisal ([Ontario, 2010b](#)) and is delineated for principals, district supervisors, and government and Catholic schools.

We selected the PQP delivered by the Ontario Principals Council (OPC) for analysis. The OPC, as the professional association for principals, offers a program distinctive from those typically run through universities. The OPC delivers the PQP throughout the province in urban and rural districts, making it one of the most widely distributed leadership programs in Ontario. OPC is the largest PQD provider in the province.

Further development

Recent changes to the OCT's PQP guidelines followed a 2012 revision of the Ontario Leadership Framework that incorporated research on high-performing systems. Accordingly, the OLF revision includes "a set of effective individual and small group leadership practices to acknowledge the unique contexts, challenges and opportunities ... for both school and system level leaders" ([Leithwood, 2012](#), p. 4).

Notably, the framework emphasizes the importance of situated, shared and relationally oriented leadership practices, as opposed to articulating a set of universal competencies that are applicable to principals in all contexts. Building on the revised OLF, the [OCT \(2017\)](#) articulated the need to address school and system leadership within Ontario's diverse cultural and educational context and updated the PQP framework in response. [Table 1](#) shows changes in the OLF, which informed the current PQP framework ([OCT 2017, 2020](#)).

In response to the framework, the OPC has articulated new modules that relate to new emphases on accountability and system leadership and OLF's emphasis on student learning and wellbeing. Modules include "Equitable and Inclusive Schools", "Inclusive Education", "Co-creating Safe Schools" and "Building Relationships with Parents and the Community" ([OPC, 2020](#)). In 2020, the OCT accredited nine program providers, which include six universities and three professional associations ([OCT, 2020](#)).

Australia (Victoria)

The Australian state of Victoria placed leadership development as key to the state's school improvement efforts ([Elmore, 2007](#)). This led to the creation of the government-operated Bastow Institute of Educational Leadership, which supported leadership development for current and aspiring school leaders. It was responsible for implementing Victoria's Developmental Learning Framework for School Leaders (DLFSL) ([Department of Education, 2007](#)). The framework was derived from [Sergiovanni's \(2009\)](#) five forces of leadership—Technical, Human, Educational, Symbolic and Cultural leadership. Competency indicators for each domain were provided to inform principal induction, development, selection, mentoring, succession planning, and professional learning ([Department of Education, 2007](#)).

No single credential was required of principals; however, Bastow developed a range of pathways for leader development. These ranged from weekend workshops to a 2-year Master of School Leadership (MSL) delivered by two providers: the University of Melbourne and Monash University. Bastow served to regulate and accredit the MSL.

Further development

Our original analysis focused on the MSL delivered by the University of Melbourne. However, structural changes quickly followed our 2012 analysis. Shifts in leader development emerged from 2015 when a new Labor government launched its "Education State" policy that aimed to make Victoria's school system the best performing in Australia. The policy aimed to bolster students' achievement, engagement and well-being. A newly established Department of Education and Training (DET) published an "evidence-based framework" for school improvement, the *Framework for Improving Student Outcomes* (FISO), which became compulsory for all Victorian government schools ([DET, 2020](#)). Professional Leadership, one of FISO's four priorities, identifies four dimensions for school leader development (see [Table 2](#)). Each is justified with reference to syntheses of research, (primarily [Day and Sammons \(2013\)](#), [Hattie \(2015\)](#), [Marzano et al. \(2005\)](#), [Robinson et al. \(2008\)](#), and [Sun and Leithwood \(2015\)](#)). Each priority is delineated on a four-point leader developmental continuum from emerging to excelling. As the governments' leadership development agency, Bastow

Table 2 Rough alignment of Victoria's DLFSL, FISO and APSP frameworks in Victoria.

<i>Developmental learning framework (DoE, 2007)</i>	<i>FISO (DET, 2020)</i>	<i>APSP (AITSL, 2015)</i>
Human	Building leadership teams	Developing self & others
Educational	Instructional and shared leadership	Leading teaching and learning
Symbolic	Vision values and culture	Leading improvement, innovation and change
Culture	Vision values and culture	Engaging and working with the community
Technical	Strategic resource management	Leading the management of the school

Institute of Educational Leadership (2020) adopted FISO as its central framework for developing teacher, principal and system leaders. Additionally, DET and Bastow adopted the Australian Professional Standard for Principals (APSP, Australian Institute for Teaching and School Leadership (AITSL), 2015) as the leadership capabilities and professional practices needed to enact FISO. Table 2 shows a rough alignment of the frameworks.

Bastow reoriented its operations toward a Brokerage model, linking a range of professional learning opportunities and providers with schools and educators. It arranged for credit transfer from some modules into postgraduate degrees at three universities. However, it positioned "Unlocking Potential" as its flagship certificate program to "increase the pool of high-quality aspirant principals". The program, launched in September 2016, uses FISO and APSP for its organizational frameworks.

Singapore: leaders in education program (LEP)

Since 1997, Singapore's educational reforms have been aligned with its vision of "Thinking Schools, Learning Nation" (TSLN) and further specified in 2005 through the state's policy initiative "Teach Less Learning More" (TLLM)" (Ng, 2008; Ministry of Education (MOE), 2005). Under TLLM, the role of school leaders stressed the development of creative and innovative transformational leaders, and instructional leaders capable of creating and implementing innovative programs for diverse learners (MOE, 2005; National Institute of Education (NIE), 2010). To achieve this goal, Singapore mandates a single pathway to the principalship through the Leaders in Education Program (LEP), a 7-month intensive full-time program, which in 2001 replaced the Diploma in Educational Administration. It is delivered only by the NIE.

In keeping with government policy, the LEP draws its framework from international models adapted to focus on promoting creativity, innovation, diversity, and distributed leadership. Singapore, like Victoria, draws on Sergiovanni's *Five Forces of Leadership* but also applies Howard Gardner's (2008) *Five minds for the future* to identify key competences and attitudes, termed mind-sets, that are "needed to perform the roles" (NIE, 2011:5–6) (see Table 3).

The framework, developed by faculty at the NIE and endorsed by the Ministry of Education is applied narrowly to the LEP, for which it was specifically created.

Further development

More recently, Singapore's MoE has adopted 21st Century Competencies (known as 21CC) as an outgrowth of TSLN and the current driver of the school system. 21CC aligns to Singapore's current economic policy aims around innovation and entrepreneurialism and, mediated by Desired Outcomes for Students, frames curriculum review and teacher professional development. Recent revisions to the desired outcomes emphasize values, emotions and interpersonal skills (MoE, 2020).

The NIE continues to offer the NEP for school and teacher leaders. The most recent program structure remains rooted in the blended Sergiovanni—Gardner framework but has added the dimension of "value-creating", a term used in Singapore's current economic policy agenda. This dimension serves to drive the Creative Action Project component of the LEP, in which participants anticipate a future-oriented need for their placement schools and design and implement innovative solutions.

Table 3 Framework guiding Singapore's LEP.

<i>Sergiovanni's framework (2009)</i>	<i>Gardner's framework (2008)</i>
Educational	The disciplined mind develops expertise in "at least one discipline" that entails a specific set of skills, knowledge and understanding
Technical	The synthesizing mind collects, analyses, evaluates, and synthesizes information from wide-ranging sources
Human	The creating mind moves knowledge ahead of technological advances through innovative questioning and thinking
Culture	The respectful mind, cognizant of the globalized world's interconnectivity, negotiates differences among individuals and societies
Symbolic	The ethical mind acts for the greater social good over self-interest

Hong Kong: certification for principalship (CFP)

Until 1999, leadership preparation in Hong Kong followed no clear, coherent pathway. A shift toward involving academics and practitioners in developing and delivering a mandatory leadership preparation credential occurred in response to two consultation reports in 1999 and 2002, resulting in establishing the Certification for Principalship (CFP) as a mandatory entry requirement for principals. The government licenses three providers, all tertiary institutes, to deliver the CFP. Providers must demonstrate an alignment of the program they designed to a required framework, *Key Qualities of the Principalship in Hong Kong* (Education Bureau, 2002; Walker et al., 2002).

The Hong Kong framework is located in a wide range of international research, which has been adapted in response to research conducted on leadership in the Hong Kong context (Walker et al., 2002). It comprises four leadership domains:

- Strategic leadership,
- Instructional leadership,
- Organizational leadership, and
- Community leadership.

These in turn inform six core areas of program foci:

- Strategic direction and policy environment,
- Learning, teaching and curriculum,
- Teacher professional growth and development,
- Staff and resources management,
- Quality assurance and accountability,
- External communication, and connection to the outside world.

The six core areas are further delineated by a structure of values, knowledge, skills and attributes that guide leadership development programs for aspiring principals, which the CFP targets, newly appointed principals, and serving principals (Education Bureau, 2002). CFP candidates complete a needs analysis, preparation for the principalship course and a portfolio.

Further development

No major changes have been made to the structure and content of the CFP over the past twenty years. However, two major policies are accounted for in program delivery. First is the introduction of the *Professional Standards for Principals of Hong Kong* in 2018 that identifies three standards that focus on student learning and personal growth:

- *Ethical enablers* of all-round growth and balanced advancement,
- *Versatile architects* of vibrant learning organizations, and
- *Visionary entrepreneurs* of educational transformation and continuous improvement.

These are articulated on a three-point continuum and are suggested as broad-based aspirational descriptors, rather than as a series of competencies. They serve as a reference point for professional development and learning, rather than as a mandate for program delivery or performance appraisal.

Secondly, following a review of professional development, the Education Bureau (2020) established a “professional ladder” from pre-service teachers through to the principalship that identifies the new teacher and principal standards as the goals for professional development, provides additional middle leader and vice-principalship positions in schools, and requires formal PD in leadership and professionalism as a mechanism for developing the leadership pool.

While the EdB has not changed any of the CFP leadership domains, program foci or delivery, it permits individual providers to include a limited number of additional topics in their programs to address the perceived needs of participants.

The United States (New York city): aspiring principals program (APP)

New York City comprises the largest public school district in the United States. Its reform efforts explicitly highlight leadership, empowerment, and accountability as its three key pillars. These aim to close the achievement gap by stressing high student standards and the use of data to drive improvement and shape accountability processes (Fryer, 2011). Within this context, the New York City Leadership Academy’s (NYCLA) Aspiring Principals Program (APP) has demonstrated its success in raising student outcomes (Corcoran et al., 2009).

The APP program framework was developed by the provider, the NYC Leadership Academy (NYCLA), and derived from multiple standards set at the national, state and city levels. Termed the Leadership Performance Standards Matrix, the framework emphasizes transformational and instructional leadership and drives content and assessment across twelve dimensions:

- Personal behavior;
- Resilience;
- Communication;

- Focus on student performance;
- Situational problem-solving;
- Learning;
- Accountability for professional practice;
- Supervision;
- Leadership development;
- Climate and culture;
- Time, task and project management, and;
- Technology. (New York City Leadership Academy (NYCLA), 2012).

This framework guides “participant selection, curricular scope, assignments, program advancement, interventions and the comprehensive evaluation of each participant” (NYCLA, 2012). Graduates must demonstrate competency in each dimension, further delineated by 55 behavioral criteria, which are in turn defined along a continuum of not meeting, progressing toward or meeting the standard. The Matrix has in turn been applied to the development of a Leadership Performance Planning Worksheet in conjunction with the states of Delaware and Kentucky and the Wallace Foundation. The Worksheet is used in the development of novice principals and is aligned to the Educational Leadership Policy Standards (ELPS, Council of Chief State School Officers, 2008), which are derived from a database of 83 international empirical studies and 47 other references.

Further development

The years 2017–2019 marked a pivotal transition for school leadership development in NYC. This period included New York City Department of Education’s (NYCDE) introduction of a new “Instructional Leadership Framework” (ILF) for school improvement that aims to build “system-wide” coherence and improve “achievement for every student” (NYCDE, 2019a, p. 1). The state formally adopted the National Policy Board for Educational Administration’s (NPBEA) 2015 Professional Standards for Educational Leadership (PSEL) to replace 2008s ELPS with effect from 2020. PSEL included new emphases on equity and cultural responsiveness, alignment from school to district while focused on school leadership, recognition that leadership is broadly based in schools, and aspirational in orientation by calling on principals to “move beyond established practices and systems” (NPBEA, 2015, p. 4) through situational awareness rather than prescribed actions.

NYCLA’s (2019) review of the APP emphasized its impact on the career pipeline of principal preparation and on the structure of principal development in other jurisdictions; but stated the program was discontinued in 2017. NYCDE (2019b) issued the Chancellor’s Regulation C-30 to regulate the requirement and procedure of principalship applications. C-30 required aspiring principals to hold School Building Leader (SBL) certification. SBL qualifications can be obtained by completing the NYCDE’s *Leaders in Education Apprenticeship Program* (LEAP)—an outgrowth of the APP, the Wallace Leadership Fellows Program offered with various university partners, or through independent coursework, such as a master’s degree or an Advanced certificate offered through different universities. The former two programs retain internships, cohort-based learning, and financial support. Holders of SBL must meet an array of criteria related to instructional leadership, school culture, school improvement, and pedagogic experience to enter the Principal Candidate Pool. Significantly, the NYCLA remains an influential partner through collaborating with universities to launch LEAP.

Commonalities, variations and trajectories in leadership preparation programs

We now look across the five programs to identify their commonalities, variations and trajectories. First, we outline our original analysis organized under the three design domains. Second, we analyze subsequent changes and their implications using the subheading trajectories. Finally, we update some conclusions around commonalities, variations and trajectories.

Frameworks

Network formation is heavily influenced by governments, central/district offices, and/or international pools of research, and mediated by regulating agencies and program providers. The frameworks are applied or adapted to guide a range of leadership development strategies and programs. Internationally respected theories and/or empirical research informed frameworks with adaptations accounting for the local context and new research findings. For example, Ontario added a fifth dimension to Leithwood et al.’s framework, Hong Kong adjusted international findings to account for local leadership research, and Singapore focused its the framework on national policy concerns of nation building and international competitiveness.

Variations across the sources of the frameworks and in their application were apparent. The Ontario and Hong Kong programs used research syntheses to design program standards and structures. Ontario applied a synthesis of Leithwood et al.’s (2006) work which was originally published by England’s National College of School Leaders. Hence, it drew partly on an established framework that had informed practices elsewhere. Hong Kong’s framework was derived from an international synthesis of literature filtered through research on leadership in the local context. The Singaporean, Australian and NYC programs provided interesting variations, all were inspired by Sergiovanni’s (2009) model. However, Singapore added Gardner’s (2008) framework as a way to focus leadership practices.

Common content areas

We noted that each program emphasizes facets of instructional and transformational leadership and addresses specific topics as determined by their respective frameworks. As presented by Walker et al. (2013), there was a great deal of commonality across a plurality of topics. The most salient common feature across the programs was that “content is to some extent determined in the form of centrally defined competency frameworks” (Ontario, Victoria, and Hong Kong) or “frameworks developed by the provider but which draw on a range of sources for their construction” (Singapore and New York). Where content expectations were delineated by regulators, providers shaped program content by allocating instructional resources, determining assessment strategies, and stressing areas of respective expertise. Coupled with this overall commonality across programs, we detail below that there are context-specific variations across programs. Variations in context and content sources shape program foci, at times narrowing the focus to the needs of communities and students.

Sources of content

In each of the programs, content was derived from leadership frameworks, however other factors shaped specific programs.

National and local contexts

By analyzing the programs comparatively, contextual features emerge as drivers of content selection. In some instances, statutory or national aims determined the key areas. The OPC’s PQP program drew particular attention to issues pertaining to inclusion and diversity, which reflected Canada’s constitutional status as a multicultural and bilingual country, and legislative requirements to address issues of access for aboriginal peoples as well as those with learning and developmental challenges (Ontario Principals’ Council, 2011a,b). The content of Singapore’s LEP aligned to aims of nation-building in an era marked by international competitiveness, globalization and societal change. This included an emphasis on *knowledge creation and innovation, the development of networks, understanding international and corporate leadership contexts, and social constructivist processes* (MOE, 2005; NIE, 2010, 2011). To provide instruction in these areas, the LEP comprised foundational coursework, a school attachment, a school based “Creative Action Project”, participation in a learning community called the “Learning Syndicate”, and “management dialog sessions” and industrial attachments (NIE, 2011). In Victoria, the state’s emphasis on leadership development informs MSL content through the government’s Developmental Learning Framework and the Bastow’s 13 core leadership modules. In contrast state defined content, New York City’s APP targets local school district concerns, which includes a large number of inner-city schools. Local needs drive its focus, emphasizing *instructional leadership* as the way to narrow the achievement gap. This specifically involves leadership preparation for instructional improvement in low-performing schools located in high poverty communities.

Student and community need

Hong Kong’s CFP addressed common content areas, but also incorporated an emphasis on a personal needs analysis that stressed the centrality of a strong and meaningful joint academic-practitioner partnership. The needs analysis formed a profile for individual participants based on multi-point feedback. Participants responded to the needs analysis by creating a learning portfolio to demonstrate their in-school learning. Instructors, mentors and syndicate group leaders, who were senior school principals, used individual needs-analysis results to provide feedback and guide participants’ development. The needs analyses were in turn used to create a cohort profile that allowed instructors to tailor the content of subsequent modules. In the OPC’s PQP, the involvement of practitioners, serving principals and district specialists, as primary instructional leaders, guest lecturers and mentors was intended to permit a focus on the particular needs of the wide-ranging communities which the program served.

Professional and academic content

Providers’ expertise, and that of their faculty members, focus program content. The OPC’s status as a professional organization gives its PQP curriculum writers access to its counseling and legal arms. This informed content pertaining to law and ethics, giving it genuine currency in these areas. In New York, the APP’s contextual aims and practitioner orientation, with instructors and mentors comprised of current and retired school leaders and district personnel, shaped the interpretation or emphasis of content. Melbourne’s MSL emphasizes leaders’ self-knowledge through “positive psychology” to ground effective leaders (Waters and Luck, 2011). The MSL program provides students with access to international researchers via the University of Melbourne faculty and visiting academics. The MSL differs from the other programs we examined given its exceptionally strong emphasis on developing leaders as researchers who contribute to theory through action research. Thus, while frameworks, often informed by state legislation, determine the primary content direction, content specification is mediated by identified student community needs and the particular expertise and organizational purposes of the providers.

Operational features

The practitioner

Practitioners taking on expanded roles in leadership preparation was apparent across all programs. Practitioners played crucial roles in providing guidance to aspiring leaders through mentorship or job shadowing and tended to be involved in all aspects of the program including on-site or in-class mentoring, formative and summative feedback. This was particularly so in the OPC’s PQP

and NYCLA's APP where practitioners acted as formal instructors and assessors, replacing positions conventionally held by university staff. Practitioners were seen to lend credibility by providing relevant tacit knowledge and the tailoring of programs to the needs and resources of their local communities. The involvement of professional mentors in Victoria or district leaders in Ontario helped contextualize the content and skills articulated in the framework. Whereas Hong Kong's CFP, the University of Melbourne's MSL, and the NIE's LEP emphasized content derived from research and academic networks to support programs.

Tripartite collaboration

Selected leadership programs leveraged tripartite collaboration among government/regulator, provider and schools. This collaboration informed the development of leadership frameworks, program regulation and content. For instance, Ontario included providers in planning the redevelopment of the PQP requirements. Tripartite collaboration permitted multiple providers to deliver the programs in a manner that ensured some continuity in philosophy and content, simultaneously catering for local needs by using local expertise. In most programs, this occurred at the school level where mentors guided aspiring leaders. The MSL exemplifies tripartite collaboration in that participants worked with three mentors reflecting professional, academic, and in-school program aims. This mirrored the tripartite aims of encouraging participants' progression along the developmental continuum, honing their skills as researchers, and meeting school needs.

Provider expertise

Across the systems, except for Singapore, candidates could choose from different providers. Providing some measure of choice to candidates appeared a significant operational feature of leadership training programs. However, once admitted to an individual program, candidates progress as cohorts through a prescribed curriculum. The providers in Ontario, New York, Victoria and Hong Kong are each among one of several in their respective jurisdictions. Programs were shaped by the providers' particular expertise. Programs offered by professional associations and not-for profit groups draw on networks and resources that differ from university-based programs. They tended to emphasize practitioner orientations, local networks, and content derived from professional sources. For example, the OPC drew on its professional networks to identify top school leaders to act as instructors.

Formal credentials

The programs delivered a range of credential options. All but the MSL led to the formal, required licensure needed to become a principal. In addition to formal licensure, some programs offered pathways to academic credentials, although in different ways. The MSL alone terminated in a postgraduate degree. However, in Ontario, the OPC was affiliated with universities in Canada, Australia and the UK which recognized its PQP as partial credit toward their master's degree programs. In Hong Kong, all providers are universities and the CFP was recognized as postgraduate credit at the discretion of the various universities. The Singaporean and New York programs led to the earning of a license but not a postgraduate degree.

Selection

All programs had rigorous selection criteria, which typically required the prior completion of other academic or professional development programs as well as the endorsement of a participants' supervisor. In Singapore, applicants compete for limited places. Singapore limited places to vice-principals and Ministry of Education officers, which also selected the participants. This limited selection may reflect the locally-gearred goals of the program. In contrast, the other jurisdictions admitted a broad range of qualified applicants.

Trajectories

Our assessment of trends since 2010 suggests that many of the above conclusions still hold. Leadership frameworks still drive most programs. Of the programs we analyzed, all have adapted the pre-existing framework (Ontario, NYC and Singapore) and/or introduced new complementary frameworks (Victoria, NYC and Hong Kong). However, we identified five adaptations over the decade.

Embedding leadership into school improvement agendas

In three instances frameworks complementary to leadership standards have been developed within the last five years that embed instructional leadership within wider school improvement goals (New York's Instructional Leadership, Victoria's FISO, and Hong Kong's Professional Standards). Across all systems except for Singapore, new or revised frameworks explicitly reference aspirational improvement-orientations and situational-contextual considerations, as opposed to essentialist core competencies applicable in all contexts.

Contextually responsive changes

Changes to frameworks and programs continue to reflect shifts in governments' economic and political agendas. This is seen most explicitly in Singapore's introduction of the new leadership domain and Victoria's new FISO framework in response to new State policy. Where available, jurisdictions have adopted or slightly adapted national standards (NYC, Victoria) and/or revised existing standards in light of new research and demands of practice (Ontario and NYC).

New content emphases

Across all societies, there were changes in the content included in frameworks and programs. These changes tracked directly to local contextual changes. The most notable inclusions are around leadership to address cultural diversity and equity, and to support student wellbeing. Hong Kong and Singapore both explicitly address the entrepreneurial side of educational leadership which calls on leaders to be adaptive, responsive and innovative. These are complementary to the aspirational nature of the frameworks as mentioned above.

Brokerage and tendering models of delivery

Similar to our previous findings, all jurisdictions except for Singapore allow for the potential of different providers. This may be through a tendering process (Hong Kong), or through alternative pathways such as state agencies, or partnerships with several universities, PD providers and NGOs (NYC, Victoria, Ontario) or through a brokerage role by which government agencies direct aspirants to different providers. Consistent across this is the notion of providing some choice in terms of the nature of the program. Choices ranged from focused modules to intensive certificate programs, to postgraduate degrees or mechanisms for postgraduate credit recognition.

Systems perspectives

In most jurisdictions, frameworks and programs are now positioned as part of a professional ladder or pipeline for leadership preparation that develops teacher leaders into senior school and district leaders. A systems perspective is also manifest in programs that see schools and the principalship as part of the broader school system. The systems view emphasizes the principal's role in forging stronger community networks and with other school and district leaders.

Conclusion

Summary

Similar trajectories of leadership preparation have emerged across the five high-performing education systems in terms of three interdependent program components—i.e., framework, content, and operation. Apart from these commonalities, we also note that differing local and national contexts have an impact on creating variations in terms of the program enactment. These are summarized as follows.

First, major commonalities in terms of framework show that these:

- are based in empirically grounded research or theory;
- are derived from research syntheses or widely respected international sources;
- provide the potential of a common leadership language across the respective jurisdiction;
- are adjusted to suit jurisdictional needs.

At the same time, however, major variations range from:

- Derived from a synthesis of research to derived from a singular theoretical construct;
- Mandated from the top (Ontario, Hong Kong and Victoria) or framed by program developers (Singapore and New York).

Observed trajectories include:

- A shift from universal competencies toward practices that are situationally conditional;
- An increasing emphasis on embedding school improvement and systems-orientations into leadership frameworks, or emphasizing these through complementary frameworks.

Second, with respect to content, major commonalities include:

- Established frameworks drive overarching content;
- Provider expertise determine specific foci;
- Practitioner involvement supports contextualization of content;
- Content tends to emphasize a change orientation and stresses instructional and transformational leadership.

Content variations include:

- Specific program foci are dictated by local concerns as mediated by the particular expertise of academics and/or practitioners;
- Content ranges from addressing “national” priorities such as globalization and the knowledge society (Hong Kong and Singapore) to more pragmatic concerns of the “local” context (e.g., NYC on closing the achievement gap).

Observed trajectories include:

- An enhanced emphasis on leadership for student wellbeing, diversity and equity;
- An emphasis on the innovative, entrepreneurial, and aspirational nature of school leadership.

Finally, major commonalities in terms of operational features include that programmes:

- Accept aspiring and potential principals;
- Have admission requirements (e.g., experience and professional qualification);
- Provide a formal licensure/certification—this is required by the system although some provide credit toward formal degrees;
- Are offered by multiple providers who are centrally selected/regulated (except Singapore);
- Are expanding practitioners' roles in line with the call for more contextualized knowledge and skills.

The variations of operational features include:

- Some programs (e.g., Singapore and NYC) offer a limited number of fully funded places to attract talent;
- Other programs (e.g., Hong Kong and Ontario) focus on wider access to potential leaders and so an expanded pool of future principals. (In Ontario, completion rates now exceed principal positions);
- Programs which encourage wide access are offered on a part-time basis (Ontario, Melbourne-Victoria, Hong Kong); highly selective programs (NYC and Singapore) are offered only on a full-time basis.
- While programs depend on a tripartite partnership, variation in operational features across programs is shaped by the key providers' particular expertise and emphasis.

Observed trajectories include:

- A tendency toward brokerage and modular delivery of training that enhances alternative pathways to principal certification;
- Locating the principalship as just one part of a professional ladder or pipeline by which prior leadership training (supported through the modular approach) serves to develop a pool of potential principals.

Implications for policy, practice and research

These findings point to several features that researchers and providers of leader development programs may consider.

First, leadership frameworks inform each program. How broadly these frameworks are applied varies. The benefits of aligning all leadership development and evaluation in a jurisdiction to a common framework allows for a common leadership language to be shared among government, regulators, providers and participants across a system. This may further promote opportunities for continued professional learning in networks across schools (e.g., networked learning communities). Such benefits should be considered in light maintaining flexibility to address local needs. In brief, program developers may consider the impact of broadly applied leadership frameworks when they further develop or revise programs for potential/aspiring principals. And indeed, official frameworks now tend to recognize the situated nature of leadership.

Second, greater openness to qualified candidates may impact healthily on a system's leadership language and networks for those who wish to build their leadership capacity without aspiring to the principalship immediately. Where programs allow all qualified candidates to participate, they broaden the pool of leaders from diverse backgrounds. As Ontario, Victoria and Hong Kong apply their frameworks to a wide range of programs, admitting participants who may not become principals serves to increase the capacity of middle leaders. Having multiple providers also broadens opportunities for more leaders to participate. Possible merits of this include that programs can train numbers beyond the positions immediately available for the principalship, embed a common leadership language (Walker et al., 2011), and even encourage teachers to see themselves as leaders (Townsend, 2011). This may boost a shared understanding of leadership among teacher-leaders at various levels, not just principal aspirants. From a practical standpoint, accepting larger numbers of candidates who meet admission requirements (e.g., Hong Kong and Ontario) could ease principal shortages in high-needs schools. Several jurisdictions now envision a pipeline of leadership preparation extending from teachers to systems leaders with modular training available at key career stages.

Third, at the same time, programs that are highly selective/competitive and provide a limited number of places (Singapore and New York City) may promote (1) smoother, more predictable program operation or management, (2) programs that can be organized and implemented around team-based learning units, (3) participants who can access more customized and intensive learning opportunities, and (4) allows those selecting to be more discerning about the talent and type of leaders they want to shape their system. Whether systems open or restrict access to programs may reflect the extent to which a jurisdiction wants to promote a common understanding of leadership for all potential leaders, regardless of their actual position or aspiration. It may also relate to funding availability, supply and demand, or desire for central quality control of programs, and ultimately schools.

Fourth, our analysis draws predominantly on documentary sources that emphasize program design. We have observed that program developers look elsewhere to inform program frameworks. However, as is common with many reform efforts, international borrowing may emphasize the needs of the state, but it is "on the ground" where adaptations to local context are made. Although the diverse aims of states and the expertise of providers may explain some variation in programs, how societal-cultural differences shape variation requires further research and the attentiveness of program designers. The documentary data used in this study did little to explain cultural impacts on program variation.

Finally, the study shows that across all programs, regardless of their national context, the role of the practitioner as mentor and trainer is gaining in currency, with alignment to frameworks often being the primary academic contribution. Where regulators delegate provision to accredited universities, professional and non-profit agencies, a measure of choice may be offered to candidates. This appears a significant option in larger jurisdictions. However, providers should carefully consider the differing expertise that

academics and practitioners can bring to leadership preparation programs. The increasing primacy of practitioners over academic staff in program implementation appears to lend credibility and relevance to leadership preparation programs. Although, the implications of this development are not fully understood, it behooves scholars to consider specifically how their role in the tripartite relationship can better inform leadership preparation programs and the potential of engaging stakeholders through diffused delivery options (Walker and Dimmock, 2005; Walker, 2015).

Quality leadership matters. A growing body of knowledge highlights the importance of educational leadership to school improvement, teacher effectiveness and student learning (Leithwood and Jantzi, 2000; Robinson et al., 2008). In fact, school leadership is second only to teacher effects in its impact on student learning (Leithwood and Seashore, 2004). Likewise, there is growing understanding of the importance of effective leadership development to high quality practice (Young et al., 2009). Given the importance of educational leadership to student learning and the importance of preparation to leadership practice, effectively developing educational leaders could not be more important.

Research accumulated over the last two decades has enhanced our understanding of the features and characteristics of leadership development that positively influence the knowledge, experiences, and skills needed for successful leadership practice (Young et al., 2009). Leadership development also shapes leadership identity, assumptions about leadership, professional aspirations and career paths.

Importantly, many educational leadership faculty members have capitalized on research and development work in the field to redesign the content and delivery of their leadership development programs to have a stronger and more positive influence on their candidates' learning, their subsequent leadership practices, and their ability to foster school effectiveness (Cosner et al., 2015). Over the past 2 decades, significant attention has been directed to innovation and best practice in leadership preparation programs, both within and outside of universities (Jackson and Kelley, 2002; Young et al., 2009; Young and Crow, 2017).

This article has several goals. In its design, it describes the broad contours as well as the core structures of leadership development in the United States (US). According to Kandel (1970), to truly understand and appreciate an education system, it is essential to know something of its history and traditions. Thus, the article opens with brief history of educational leadership development in the United States, highlighting major markers in the development of the field. The three subsequent sections build on three key elements of the historical overview: (1) the field's evolving understanding of educational leadership, (2) efforts to professionalize the field through the development of a knowledge-base and standards, and (3) work to build a research-based understanding of quality leadership preparation. This is followed by a review of the key features of leadership preparation in the United States.

While the diffusion of research and concepts on preparation from the US and other countries has gone on for many years, and while some issues and trends may be relevant to scholars and educators in other national contexts, it is unlikely that work is universally applicable. This article offers an analysis of US-based educational leadership development research, rather than proposing a definitive statement about leadership preparation, writ large.

The history of leadership development in the US

As in many countries, the position of school leader in the US was originally bestowed upon head teachers. Over time, as school systems in the US have become more complex and definitions of educational leadership have evolved, the requirements of taking a leadership position have increased. In the majority of states, in order to lead a school, one must hold a special license or

certification that affirms their expertise to hold an educational leadership position. Typically, certification is tied to the completion of a graduate level educational leadership program, and in some cases, earning a master's degree.

The preparation of educational leaders in the US can trace its origins to the early part of the twentieth century, though it came into its own in the 1950s. Since that time, leadership development in the US has consisted of both pre-service for aspiring administrators and in-service preparation, both of which are designed to develop leaders in specific knowledge and skill domains. For the most part, pre-service preparation is provided by universities and in-service preparation is provided by professional organizations or through collaborative efforts between universities and school districts following initial preparation.

In the early years, the preparation of educational leaders borrowed concepts from private sector management, reflecting a concern with efficiency and an emphasis on rationalizing educational organizations (Black and Murtadha, 2007; Murphy, 2003). Drawing from the behavioral sciences, leadership research sought to identify key best practices or models of effective leadership that could be generalized across contexts and taught to future educational leaders. Subsequently, educational leadership scholars began borrowing from fields like human relations, sociology, political science, etc. Ideas and frameworks borrowed from these fields were used to guide leadership development and to explore what leaders did and how they thought and felt.

Beginning in the mid-1980s, both the preparation and professional development of educational leaders became the focus of much criticism and reform (Young et al., 2015). Several national commissions, task forces, and individual scholars examined the nature of leadership and university-based leadership preparation programs. These efforts were instrumental in shedding light on how demands for reform were altering the nature and direction of leadership development programs. The first major effort to address criticisms of the field was undertaken in the mid-1980s when the National Commission on Excellence in Educational Administration (NCEE) was developed. In 1987, the NCEE issued a set of eight recommendations:

Calling for the redefinition of educational leadership; the establishment of a national board to shape policy related to school administration; the modeling of administrator preparation programs after other professional schools; a reduction in the number of preparation programs; the increased recruitment, preparation, and placement of ethnic minorities and women; the establishment of partnerships with the public schools in the preparation of school administrators; increased emphasis on professional development for practicing administrators; and reform of licensure and certification.

Forsyth (1999, p. 75).

These recommendations influenced thinking about school leadership development and were widely endorsed across the 50 states in the US. Following the release of NCEE's report, efforts focused on supporting the quality of leadership preparation intensified. For example, the Danforth Foundation launched a major initiative to support preparation program redesign and innovation, the National Policy Board for Educational Administration (NPBEA) was established, and a multi-state initiative was launched to develop standards to guide the preparation and practice of educational leaders (Young et al., 2002).

Although many of NCEE's recommendations were implemented and made significant and positive impacts on the field, satisfaction with their impact was short lived. By the early 2000s, a new wave of critique was in full swing and they were coming from many directions. In 2006, the Southern Regional Education Board (SREB) report, *Schools Can't Wait: Accelerating the redesign of university educational leadership preparation programs* argued:

There is a lack of urgency for refocusing the design, content, process, and outcomes of principal preparation programs based on the needs of schools and student achievement and little will happen until there are committed leaders of change at every level—state, university, and local school district.

Fry et al. (2006, p. 4).

The report also criticized faculty independence in course content development and resistance to changing current coursework. Similarly, the report, *Educating School Leaders*, launched a high-profile critique of the quality of educational leadership programs, arguing that leadership preparation programs lacked purpose, curricular coherence, adequate clinical instruction, appropriate faculty, and high admission standards (Levine, 2005). The report also questioned district and state policies that based salary schedules on the acquisition of graduate degrees and credit hours and claimed that the field would be better served by requiring a Masters of Business Administration.

Critiques also focused on program assessment. Here, critics argued that preparation programs had not systematically examined the efficacy of their own practice. Research on practicing school leaders indicated that preparation programs did not prepare them sufficiently for the myriad demands of their job (Fry et al., 2006; Schulman et al., 2006). Due to the lack of focus on program assessment, programs had little evidence from which to respond to such critiques. Soon thereafter, the University Council for Educational Administration (UCEA) took several important steps to rectify this situation. First, in 2000, UCEA launched a leadership preparation program evaluation initiative. Subsequently, in 2001, it spearheaded the National Commission for the Advancement of Educational Leadership Preparation (NCAELP), and in 2004, it formed a Joint Research Taskforce on educational leadership preparation. These efforts will be described in greater detail later in this article.

Educational leadership: an evolving understanding

Grogan and Andrews (2002), described early university leadership preparation programs as preparing aspiring administrators for the role of a top-down manager, emphasizing courses on management, administration, planning, supervising, budgeting, scheduling, etc. In their historical overview of the preparation of school leaders, Murphy and Vriesenga (2004) concurred with this characterization and charted several distinct waves of educational leadership scholarship, each with its own impact on leadership development. The periods included the ideological era (1820–1900), the prescriptive era (1900–1915), the scientific era (1947–1985) and the dialectic era (1986–2006). Over time, they argued, the content and character of leadership preparation in the US changed, with the most recent major shifts occurring in the 1980s shifting from a more conventional emphasis on school management to an emphasis on leadership, shared governance, participatory decision making, and school-based councils; in the late 1990s shifting to learning focused leadership; and in the early 2000s adding distributed and equity orientations to learning focused leadership.

In the 1990s, several ideas were particularly influential on the field of educational leadership in the US: learning organizations and leadership for learning. The notion of a learning organization, introduced by Senge (1990) shifted the way many scholars thought about schools from static organizations that required technical management to dynamic, non-stable, and self-generating organizations that required leadership and management (Senge, 1990). Additionally, a focus on leading learning, which emerged from the effective schools' literature shifted emphasis to specific ways educational leaders exercise a powerful influence on student achievement (Leithwood and Jantzi, 2000). Finally, a focus on working for equity emerged in the 2000s as a counterforce to the accountability movement, placing emphasis on the current and future needs and aspirations of each and every child. In response, leadership preparation programs began emphasizing transformational and instructional leadership (Firestone et al., 2004).

In many ways, these adjustments in focus reflect larger changes in theory, policy and general society. They also reflect efforts within the field to define educational leadership, to identify a knowledge base and to develop a set of national standards for leadership preparation and practice. Furthermore, they reflect critiques of such efforts (Dantley and Tillman, 2006; Donmoyer et al., 1995; Marshall and Oliva, 2006). Critical scholars were particularly active during the late 1990s and early 2000s, exposing the limitations of leadership models that downplayed context and equity, while overemphasizing heroic notions of leadership and leadership characteristics (Bennett and Anderson, 2003). Many of these same scholars, argued that traditional notions of leadership were "inherently biased toward maintaining stability, and thus served to reproduce inequity in education" (Black and Murtadha, 2007, p. 2).

Defining educational leadership

Starting in the mid-1980s, several efforts were undertaken to define the knowledge base in educational leadership and to use that knowledge base to develop a set of standards for the field (Donmoyer et al., 1995). In the early years, efforts to define standards were undertaken chiefly by organizations involved in the NPBEA with university faculty and practitioners playing a limited role; however, in more recent years the scope of engagement has enlarged significantly.

In the mid-1990s, UCEA engaged scholars from across the country in defining the knowledge base in educational leadership. Considered a controversial project by some, the UCEA Knowledge Base project resulted in the identification of seven knowledge domains: (1) societal and cultural influences on schooling, (2) teaching and learning processes, (3) organizational studies, (4) leadership and management processes, (5) policy and political studies, (6) legal and ethical dimensions of schooling, and (7) economic and financial dimensions of schooling. In support of these seven areas, which "currently recognized for comprising the field" and serve as organizers for mapping educational administration," UCEA scholars developed a document warehouse of what they considered to be essential readings on educational administration (Bredeson, 1995, p. 52). The document warehouse, titled *Primis* and published for UCEA by McGraw Hill, enabled faculty to develop course readers from the identified knowledge base.

Soon thereafter, the NPBEA initiated the development of the Interstate School Leadership Licensure Consortium (ISLLC) standards for the professional practice of school leaders. The purpose of the ISLLC standards, according to consortium's sponsoring organization—the Council of Chief State School Officers (CCSSO)—was to provide a clear, organized set of criteria that could be used to drive the preparation, professional development, and licensure of school leaders. Murphy (2003), noted that two questions were central to the standard setting work: (1) "What do we know about schools where all youngsters achieve at high levels?" and (2) "What do we know about the actions and values of the women and men who led effective schools and productive school systems?" (pp. 7 and 9). Extensive research reviews were conducted on each of these questions to identify the key responsibilities and practices of effective educational leaders. The resulting ISSLC standards provided a foundation for the field of educational leadership that was significantly different and more comprehensive than previous notions of educational leadership (Young et al., 2009). According to Murphy (2003), the standards pushed the field from a focus on administration and management to leadership and learning.

However, the ISSLC standards have not been immune to criticism (Canole and Young, 2013). Some of the more significant and recurring concerns included: (1) a lack of direct connection between the leadership standards and supporting student achievement gains, (2) the omission of specific areas like school technology leadership and data use, (3) the under-specification of criteria to be met, (4) the lack of consideration given to the role of context in leadership practices, (5) an assumption that leadership is provided

by a single person, (6) the lack of focus on issues of diversity, equity or inclusion, and (7) the failure to identify the empirical knowledge/research base upon which the standards are based.

Nonetheless, the ISSLC standards substantially influenced preparation and professional development in the US. By 2001, 35 states had adopted or adapted the standards for use in guiding the practice, preparation and professional development of educational leaders. Complementing this effort, the Education Testing Service (ETS) used the ISSLC standards to develop a performance-based assessment, the School Leaders Licensure Assessment (SLLA), to assess proficiency in each of the standard areas and thus the effectiveness of leadership preparation and professional development. By 2008, when the ISSLC standards were last revised, almost 40 states had adopted or adapted the standards as platforms for licensure, evaluation and professional development, and many also required universities to align their leadership preparation programs to the standards.

The ISSLC standards were moderately revised in 2008 and then overhauled in 2015, resulting in the adoption of the Professional Standards for Educational Leaders (PSEL). The PSEL standards include the following ten domains:

1. Mission, Vision, and Core Values
2. Ethics and Professional Norms
3. Equity and Cultural Responsiveness
4. Curriculum, Instruction and Assessment
5. Community of Care and Support for Students
6. Professional Capacity of School Personnel
7. Professional Community for Teachers and Staff
8. Meaningful Engagement of Families and Community
9. Operations and Management
10. School Improvement (NPBEA, 2015, p. 3)

Notably, the standards emphasize the importance of both academics as well as the support and care required for students to excel. “The 2015 Standards have been recast with a stronger, clearer emphasis on students and student learning, outlining foundational principles of leadership to help ensure that each child is well-educated and prepared for the 21st century” (NPBEA, 2015, p. 3). Collectively, the ISSLC 1996, ISSLC 2008 and PSEL 2015 standards have provided guidance for leadership preparation, practice and evaluation at the state level for over 20 years.

According to Crow et al. (2008), similar sets of competencies have been adopted in other countries. Despite widespread acknowledgment that cultures vary considerably and that leadership preparation and development could be adjusted in relation to culture, the content, method of delivery and assessment of preparation and development shows relatively little variation throughout the world (Bush and Jackson, 2002).

Researching quality preparation

In 2000, the NPBEA established a working group with representatives from AACTE, ASCD, AASA, NASSP, NCPEA, NAESP, NASB and UCEA to design program accreditation standards for the National Council for the Accreditation of Teacher Education’s (NCATE) Specialized Professional Association (SPA) review of educational leadership programs. These standards, which were adopted by NCATE in the spring of 2002, have undergone several revisions and were recently revised and renamed the National Educational Leadership Preparation (NELP) standards (Young et al., 2018). The new version, which is aligned to the PSEL standards is strongly anchored to the research based on leadership practice and effective preparation (Young et al., 2017). The NELP standards are not only used in national accreditation, but they are also used by states for program review and approval (National Policy Board for Educational Administration, 2018a, b).

In addition to these national efforts, researchers have worked to develop an empirical base of knowledge to guide preparation program improvement efforts. Both individual researchers and organizations have participated in these efforts. For example, in 1999 UCEA conducted a study of school principals and superintendents, their jobs, preparation and the problems they faced. In 2000, UCEA affiliated with Division A of the American Education Research Association and the Learning and Teaching in Educational Leadership (LTEL) special interest group to develop a joint research taskforce to design evaluation tools and support research on educational leadership preparation. The field needed to have useful data for program improvement and accreditation purposes.

In 2003, following the recommendations of the National Commission on the Advancement of Educational Leadership Preparation (NCAELP), UCEA spearheaded a Joint Taskforce on Research on Leadership Education under the sponsorship of UCEA, NCPEA (National Council of Professors of Educational Administration), Division A of AERA (American Educational Research Association), and the TEA-SIG of AERA. Despite methodological challenges, the taskforce developed multiple research strands, including studies focused on specific program attributes, longitudinal studies of preparation programs and their impact, and backward mapping studies that examined effective schools, the nature of their leadership, and the source of their leadership skill development.

These two taskforces engaged in individual and joint research on leadership preparation, leading to significant increases in the knowledge base. Their work, along with expert opinion, provided important insight into a set of essential core program attributes, including a well-defined, leadership-for-learning focus; coherence; challenging and reflective content; student-centered instructional

practices; competent faculty; positive student relationships; a cohort structure; supportive organizational structures; and substantive and lengthy internships (Darling-Hammond et al., 2007; Jackson and Kelley, 2002; Young et al., 2009). Research continues to evolve around the above-mentioned preparation program features as well as their effects on graduates' knowledge, movement into leadership positions, and leadership practices.

To support this work, UCEA established new outlets for publishing and disseminating research, including the first peer reviewed journal focused on school leadership development, the *Journal of Research on Leadership Education* (JRLE) as well as two editions of the *Handbook of Research on Leadership Education* (Young et al., 2009; Young and Crow, 2017). In addition to fostering the development of a base of research on leadership education that provides insight into the development and delivery of leadership education, these publications also provide information, case descriptions, and data that enable larger conversations about leadership education.

As noted above, UCEA has played a pivotal role in developing a process for documenting the practices of educational leadership preparation programs. In 2011, a group of researchers from UCEA and the Utah Education Policy Center developed and validated the INSPIRE Leadership Survey Suite, which examines the programmatic elements of educational leadership preparation programs and the experiences of program participants both while they are in the program and once they have taken leadership positions. The INSPIRE Leadership Surveys are aligned to PSEL and NELP standards and provide data to help programs examine relationships between their program features, graduate student experiences and their practice once they assume leadership roles (Ni et al., 2019). Today, the INSPIRE leadership survey suite, which includes a program, graduate, leader in practice and 360 surveys, is used by many programs in the US to document their programs and gather data from graduates and their employing organizations. The critical friends review process, which involves having external site visitors review and provide feedback on program quality, is also commonly used by programs in the US.

The above described efforts have had an important impact on preparation programs in the United States. For example, an increasing number of programs have adopted research-based program features, and many have increased opportunities for candidates to deepen their understanding of critical leadership practices, such as building a collaborative vision, supporting and advocating for student learning, fostering and engaging in data-informed decision making, developing a supportive organizational and instructional culture, seeking out and incorporating diverse perspectives, engaging stakeholders, acquiring and effectively using resources, and reflecting on how their knowledge bases interact with each other and how to apply them (Leithwood et al., 1996; Young et al., 2009).

Leadership development

What has resulted from the increased emphasis on quality preparation? What does preparation entail in the US? Research on leadership preparation has identified a number of program features as essential to high quality preparation. These include: (a) selective admissions, (b) cohort structures, (c) curricular coherence, (e) powerful learning experiences, (d) field-based experiences, (f) mentoring and coaching, and (g) collaboration between universities and school districts (Darling-Hammond et al., 2007; Jackson and Kelley, 2002; Young and Crow, 2017; Young et al., 2021). In the following sub-sections, I review each of these leadership preparation program features. In doing so, I highlight a number of US leadership preparation programs that have been identified by experts in the field as exemplary or innovative (Jacobson et al., 2015; Young, 2015; Young et al., 2021) or which have been recognized by the UCEA Exemplary Educational Leadership Preparation (EELP) award.

Student selection

Selective admissions is a key characteristic of exemplary preparation programming (Fry et al., 2006). In the typical program, applicants are identified, selected, and screened to reflect leadership potential. How these functions are conducted and why differentiates the average program from the exemplary. In most programs, applicants are asked to submit their academic credentials, an essay and a set of recommendations from individuals who they feel can speak to their leadership potential. Based on this information, the applicant's grade point average, and their score on the Graduate Record Exam (GRE), program faculty select candidates who they believe will gain from and contribute to the program in meaningful ways.

Student selection practices in exemplary programs may use some of these same resources for the first phase of the screening process, but not to determine who they will ultimately invite to participate in the program. Rather, selection processes in exemplary programs usually develop from the program's purpose and theory of action (Young et al., 2021). That is, how the program goes about selecting candidates for the program will reflect the program's purpose and assumptions about leadership and its development. For example, the process used by the University of Texas at Austin assumes that school leaders must be able to transform schools into educational environments that work for each and every child, and, as a result, program faculty select candidates who are excellent teachers and who can provide evidence of teacher leadership. In addition to evaluating each application portfolio, a team of observers visits each applicant's classroom to assess teaching quality and to personally interview the applicant and his or her supervisor.

At the University of Illinois-Chicago, the selection process begins with the review of candidate application materials (Cosner et al., 2015). Potential candidates must have a master's degree and a grade point average (GPA) score of 3.5 or better. The faculty also review the candidates' GRE scores, personal statements, and letters of reference. In their review, they look for evidence of

successful teaching and leadership of adults to achieve shared goals. The next phase of the selection process involves a campus interview experience. Applicants who are selected for campus visits are forwarded case material on a struggling school in advance of the interview. During the campus interview, candidates: (1) observe and orally respond to questions about an instructional video, (2) present an analysis of a struggling school, (3) respond to an oral examination of his/her portfolio, and (4) respond to a writing prompt.

Cohorts

In many exemplary programs applicants are selected as a cohort (VanGronigen et al., 2018; Young et al., 2021). This is often based on the assumption that part of the learning that takes place in leadership development is peer to peer as well as the desire to foster a sense of community, social capital, and enhanced academic depth and to develop a mix of students that will support one another's learning and development (Barnett et al., 2000; Young et al., 2009). Ninety percent of UCEA programs use a full (55%), partial (13%), or de facto (13%) cohort model.

A full cohort model is a defined group of individuals who begin the program together and stay together throughout the entire program, a partial model is where there is defined group of individuals for some of their courses, and the more informal de facto model is where students enter at the same time and take the majority of the same courses and in the same sequence but are not deemed a cohort.

Anderson et al. (2017, p. 17).

For example, Loyola Marymount and Brigham Young Universities use cohorts with the intention of developing professional learning communities and career-long networks. Similarly, the University of Washington, the University of Texas, and the University of Illinois-Chicago organize students into cohorts for the duration of their program offering highly specified and sequenced courses that enhance cohort-based learning.

Curriculum

In effective programs, there is a clear, well-defined curriculum that reflects agreement on the relevant knowledge and skills needed for educational leaders in their first year, or first few years in the profession (Young et al., 2021). As such, contemporary leadership preparation curriculum reflects the heightened emphasis on school improvement (e.g., courses focused on change, applied research and data analysis), equity and social justice (e.g., courses on diversity, culturally responsiveness, advocacy and engagement), and talent management (e.g., courses on hiring, building a collaborative learning culture, and teacher supervision and development). For example, in the University of Illinois-Chicago program, the curriculum is designed to support the program's logic model which focuses on the processes through which leadership supports student learning and school transformation. The program curriculum has three strands: (a) instructional diagnosis and development, (b) organizational/leadership diagnosis and development, and (c) cycles of inquiry for school-wide improvement (Cosner et al., 2015).

Although program faculty ultimately determine course content, national, state and, in some cases, district leadership standards are used to frame preparation program focus and alignment. Subsequent to the adoption of the ELCC or NELP standards for the accreditation review of leadership preparation programs, their impact was significant (Canole and Young, 2013; Young et al., 2009). Over a third of all leadership preparation programs in the US had received national recognition from NCATE between 2002 and 2012, and that number grew under the Council for the Accreditation of Educator Preparation (CAEP). According to Young et al. (2017) that number is now close to 1000.

Like accreditation, state licensure policy has also supported the adoption of a default "national curriculum" in educational leadership preparation. Only a few of the states in the US have resisted adopting the ISSLC standards since their development in the late 1990s, and many are in the process of adopting the latest version, the PSEL standards (Young et al., 2017). As noted in a previous section, state adoption of standards not only provides a common vision of leadership preparation, it tends to impact the content and focus of preparation, practice, evaluation and professional development.

Importantly, a curriculum based on standards, such as the NELP standards, conveys a hidden curriculum (Osterman and Hafner, 2009). That is, what is included in the standards conveys a larger conception of what counts as educational leadership, what knowledge and skills novice leaders should accrue before taking a position, as well as what quality educational leaders do. As such, other thoughts and practices that do appear within the standards and components are excluded and by their exclusion can be interpreted as not essential to the practice of beginning leaders (Young et al., 2017). The standardization of what counts as leadership (and what does not), as well as what knowledge is considered an essential part of the leadership knowledge base, has drawn significant criticism over the years.

Teaching

The short history of preparation for educational leaders is punctuated by research and development activity around the issue of pedagogy. UCEA archives are full of simulation and case study materials dating back to the late 1950s. Simulations and cases were considered to be the state of the art in the 1950s, just as problem-based learning and the use of district data-sets were considered cutting-edge in the late 1990s (Bridges and Hallinger, 1997; Copland, 2003). Today, evidence suggests the continued use of

Table 1 Powerful learning experiences framework.

Features	Descriptions
Authentic	The learning experience reflects an authentic, meaningful, and relevant aspect of leadership practice.
Active engagement	The learning experience requires active engagement (e.g., examining, diagnosing, and addressing problems of leadership practice, linking theory and practice).
Sense-making	The learning experience fosters sense-making around critical problems of leadership practice.
Centers equity	The learning experience requires that candidates explore, critique, and deconstruct problems, beliefs, practices, and policies from an equity perspective.
Reflection	The learning experience requires reflection.
Collaboration and interdependence	The learning experience requires collaboration and interdependence.
Responsibility for learning	The learning experience empowers learners to take responsibility for their own learning.
Learner and knower	The learning experience positions both professor and students as both knowers and learners.
Broadens perspective	The learning experience broadens and shifts perspective from the classroom to school, district, or state level.
Confidence building	The learning experience develops confidence in leadership.

problem-based learning, case studies and the encouragement of individual and group reflection (Young and Crow, 2017). In a study of UCEA programs, Anderson et al. (2017) found that “UCEA programs create learning experiences that reflect the job of a practicing administrator by assigning field-based, course-related projects (95%), using problem-based learning (83%), requiring action research or inquiry projects (75%), and analyzing case studies (78%)” (p. 12).

Problem-based and case-based teaching methods are increasingly the primary mode of teaching in educational leadership preparation programs. These pedagogical tools offer situated learning and an opportunity to experiment with multiple perspectives within a traditional classroom setting. Representing real world situations, case studies and simulations can provide powerful learning opportunities that draw attention to meaning making, patterns of behaviors, beliefs and values, and economic and political structures. Similarly, problem-based learning, an approach adapted for educational leadership by Bridges (1992), provides an opportunity to ground aspiring leaders in the problems of their context, expanding their problem-framing and problem-solving capabilities, and working on problems collaboratively with others.

Building on some of the work in adult learning, in the early 2000s UCEA fostered conversations around the development of a signature pedagogy in school leadership development, one that would include problem-focused learning, action research and other transformative learning experiences (Mezirow, 1991; Black and Murtadha, 2007; Cunningham et al., 2019). According to Schulman (2005), a signature pedagogy is “... a set of assumptions about how best to impart a certain body of knowledge and know-how. And it has an implicit structure, a moral dimension, that comprises a set of beliefs about professional attitudes, values, and dispositions” (p. 55).

Drawing from developments in adult learning theory and principles, such as Mezirow (1991), the signature pedagogies promoted by UCEA scholars (e.g., Black and Murtadha, 2007; Young et al., 2017; Cunningham et al., 2019) incorporate experiential learning, reflective practice, structured dialog, problem-based learning and learning communities in their courses. For example, Cunningham et al. (2019), VanGronigen et al. (2018) and Young et al. (2021) promote the Powerful Learning Experiences (PLE) framework captured in Table 1.

Pedagogical features, like those included in the PLE framework address the concern that “school leaders too often remain overly localized with little of the peripheral vision that data, theory, and processes of inquiry might foster” (Black and Murtadha, 2007, p. 12).

Along these same lines, Young et al. (2017) suggest that aspiring leaders develop three core propensities: critical reflection, critical consciousness, and multiple perspective taking. The first propensity, critical reflection, is a process that enables a leader to examine long-held, socially constructed ideas, beliefs and assumptions about their experiences (Mezirow, 1991). Reflective practice is increasingly structured into and throughout programs as a means of provoking and challenging students’ presuppositions, helping them to surface theories-in-use that shape behavior, and enabling them to try on other frames for leadership development (Young et al., 2017). The second, critical consciousness, is a tool for engaging in “broad social analysis, to take a macro level perspective, which is essential to understanding education and its place in society, to thinking about it strategically and to potentially change it” (Young et al., 2017, p. 251). The third propensity, multiple perspective taking, involves the “ability and desire to consider issues from a variety of theoretical, experiential and epistemological perspectives” (p. 251). Multiple perspective taking enables leaders to better understand problems, issues, and relationships, to check their understanding or tenets, which were formerly accepted as given (Young, 1999). Together, critical reflection, critical consciousness and multiple perspective taking, enable a leader to see and think in new and fresh ways.

Field-based experiences

Although internships only began to appear in educational leadership training in the 1950s, field-based experiences are now considered a cornerstone of educational leadership preparation programs. [Reyes-Guerra and Barnett \(2016\)](#) report that around 90% of leadership preparation programs require the internship. While research on internships, practica, apprenticeships and other field-based experiences is less robust than other areas, available research points to its importance and state policy and national accreditation bolster its wide-spread use. According to [Reyes-Guerra and Barnett \(2016\)](#), two goals provide a foundation for the wide-spread use of internships:

On one hand, these experiences are intended to have general effects on participant learning, which include encouraging independent learning, improving self-confidence, promoting social justice and change, and increasing the commitment to school leadership as a career. On the other hand, internships are structured to strengthen learners' specific leadership and administrative skills, such as communication, personnel evaluation, collaboration, and resource management. By directly experiencing and practicing administrative tasks and responsibilities, aspirants learn about the role, how to perform the job, and why to take certain courses of action (p. 8).

The majority of states in the US require an internship experience as part of educational leadership preparation. However, requirements differ from state to state. For example, the state of North Carolina requires a yearlong internship for all administrator candidates, while Illinois requires a yearlong part-time internship. The state of Colorado does not specify whether the internship needs to be full-time or part-time; instead it requires a minimum of 300 h of supervised field-based experiences.

In some states, funding is provided to off-set the cost of these mandates. For example, the state of Washington offers a state-funded school leadership internship program wherein funds are provided directly to school districts to cover up to 45 days of release time for participating school leadership candidates. The state of Mississippi provides a limited number of year-long sabbaticals with full pay and benefits to teachers enrolled in educational leadership programs to support their participation in a full-time internship.

To achieve national recognition through the CAEP's NELP SPA, programs must have a high-quality internship. CAEP and NELP standards include a specific focus on clinical experiences for advanced programs in educational leadership. For example:

The provider works with partners to design clinical experiences of sufficient depth, breadth, diversity, coherence, and duration to ensure that advanced program candidates demonstrate their developing effectiveness in creating environments that support all students' learning and development. Clinical experiences, including technology-enhanced learning opportunities, are structured to have multiple performance-based assessments at key points within the program to demonstrate advanced program candidates' development of the knowledge, skills, and professional dispositions, as delineated in Standard 1, that are associated with creating a supportive school environment that results in a positive impact on the learning and development of all P-12 students.

CAEP (2015, p. 6).

Most internships involve over 300 contact hours and span at least two semesters. In some programs, the internship extends through a program's 2-year duration. In a handful of programs, like that of the University of Illinois-Chicago, the internship is full-time; however, in most programs the internship is a part time experience. In the latter situation, field-based experiences are typically integrated into course work. In these programs, the curriculum is sequenced and mapped against the annual cycle of regular work responsibilities of educational leaders and leadership standards and the program's vision of leadership for learning ([Young et al., 2021](#)). Furthermore, reflection, portfolio development and coaching and mentoring have been incorporated into internships to encourage theory-to-practice connections and generally make them more meaningful learning experiences.

A sizable amount of research has been devoted to the importance of mentoring and coaching as an important component of aspiring leaders' learning about leadership ([Reyes-Guerra and Barnett, 2016](#)). During clinical experiences, coaching and mentors serve a key role in developing aspiring leaders' capabilities to improve instructional practices, provide meaningful professional development for teachers, and lead school improvement initiatives.

Partnerships

Less than 20 years ago, district-university partnerships were small-scale initiatives involving districts and regional colleges and universities. Today, however, district and university collaborations around preparation are increasingly common and involve colleges and universities of many sizes. Moreover, the nature of the collaborations tends to be much more substantive and reciprocal, reflecting leadership needs for local contexts (e.g., high teacher turnover, turnaround schools). District leaders are no longer relegated to university program advisory boards; rather they participate as partners in program design and delivery.

District partnerships often involve a number of activities, include partnering with universities to identify and screen candidates, carefully prepare mentors, shape the curriculum content and delivery, and assist in assessing candidates' leadership capabilities. According to research on UCEA programs, the most frequent form of collaboration was for districts to partner with the university to support the organization and supervision of the internship (92%). Those programs with more extensive formal relationships had official memorandums of understanding (47%) and structured advisory committees (44%) ([Anderson et al., 2017](#)).

According to research on leadership preparation, learning is advanced through university–district partnerships that tailor preparation to the needs of the districts, more closely aligning theory to practice, and use internships that provide candidates with the opportunity to practice in core leadership responsibilities (Anderson et al., 2017). In a study of high-quality programs described as exceptional, Jackson and Kelley (2002) found that programs partnered in a variety of ways, including: (a) the selection and recruitment process, (b) the continued support of program elements, and (c) the organization and development of the clinical experience.

Additionally, partnerships often develop beyond the provision of pre-service experiences, to the development of leadership development pipelines, which include components of recruitment, preparation, selection, induction, development, and evaluation of school leaders. Hitt et al. (2012) conceptual model of the leadership professional pipeline divides the pipeline by preservice and in-service leadership. Research presented with this model demonstrates the growing knowledge base about effective leadership practices, important relationships between preservice and in-service, and the need for “strategic and intentional coordination of efforts by multiple stakeholders in leadership preparation and practice” (Hitt et al., 2012, p. 1). This model provides an outline for building, monitoring, and evaluating a professional pipeline from preparation to career-long learning.

Program faculty

The personnel staffing a program are fundamental to program quality (Young and Crow, 2017; Young et al., 2009). Thanks to a series of national surveys beginning in 1973 (Campbell and Newell, 1973) and continuing under the leadership of Martha McCarthy (Hackmann and McCarthy, 2011) we have a longitudinal knowledge base on faculty characteristics and trends over time. Most pertinent to this article are the following findings: (1) an increasing number of educational leadership faculty today have prior administrative experience, and (2) there are increasing numbers of part-time clinical and adjunct faculty in preparation programs and a decreasing number of full-time clinical faculty members (Hackmann and McCarthy, 2011).

According to Darling-Hammond et al. (2007), faculty knowledge is most closely associated with program quality. In their review of exemplary programs Jacobson et al. (2015) found that having a critical mass of faculty with strong content knowledge and experience was very important, as was the stability of program leadership and staff support.

At UCEA institutions, full-time faculty members provide the majority of instruction. UCEA programs use tenured or tenure-track faculty to teach over half (55%) of the courses, and clinical instructors teach a third (33%) of courses (Anderson et al., 2017). Part time instructors, such as adjuncts (often current practitioners) also contribute approximately 30% of instruction in UCEA programs. Furthermore, 99% of programs call upon practitioners to present to classes and other program events as guest speakers or panelists. In addition to teaching and presenting, practitioners are often utilized in supporting or supervisory roles, such as the supervision of clinical fieldwork as well as to help with programmatic decision making (89%) and design work. Thus, it appears that few UCEA programs are working in isolation in the proverbial “ivory tower;” rather, the majority work with practitioners to select candidates, design coursework and delivery of instruction, and to support the clinical component.

In addition to having a strong faculty, research also indicates that faculty community is an important condition of program quality and a focus on continuous improvement. The universities identified as exemplary by the UCEA EELP award all have very strong and engaged faculty communities (Jacobson et al., 2015; Young et al., 2021). For example, the UIC faculty culture focuses on continuous improvement which mirrors the approach taught within their program to aspiring leaders. The faculty have established work routines and cycles of inquiry that enable them to ensure they are continuously adapting the program to meet the needs of their student population.

Due to major breakthroughs in research as well as significant investments in program improvement and policy alignment to this research, preparation in the US, is becoming increasingly aligned with the research on exemplary preparation programs. How well this reflects preparation in other areas of the globe, remains to be seen.

Conclusion

Never has it been more important to have learning focused leaders who understand teaching and learning. “There’s nothing new or especially controversial about that idea,” yet how to ensure consistently high-quality leadership for all schools continues to be a challenge (Leithwood and Seashore, 2004, p. 1).

One of the challenges and opportunities of designing, delivering and researching educational leadership development is the dynamic nature of the field. Educational leadership is affected by rapid and evolving knowledge on learning, teaching and leading, the demands of society, the persistent demographic changes of schools, and the increasing complexity of the job of school leader. As a result, leadership preparation and development should be considered an evolving and dynamic area of work, wherein curricula, teaching methods and modes of delivery evolve with developing needs and understanding.

Furthermore, context matters. As noted in the introduction, this article offers a context-bound treatment of leadership development, firmly anchored in the US experience. What worked in the US, may work less well in other contexts. History, culture, language and the role and structure of education and policy systems differ from nation to nation, making the transfer or translation of practices from one context to another complicated. Nonetheless, several lessons learned through the US experience may prove important to a spectrum of contexts. For example, while the importance of leadership in education is increasingly considered common

knowledge across the globe, the idea that leaders require high quality preparation and development is less widely accepted. Yet, quality preparation and development has been proven to make a significant difference in the practice of school leaders in the US and could potentially make an equally important impact on the quality of education in other countries.

The US journey to understand what counts as effective leadership and leadership preparation provides a road map that prove useful to other nations. Key elements of the US journey included broad participation and collaboration, the development of leadership standards that reflected a wide-spread understanding of effective leadership practice and preparation, and the creation of and dependence on a research infrastructure to inform standards for preparation and practice. The importance of research cannot be overstated. It is through research that we have been able to identify the key areas of leadership to leverage for increased student learning and success, and it is through research that we continue to build our understanding of the kinds of development experiences that lead to effective leadership practice.

In the US and elsewhere, dedicating resources to understanding effective leadership preparation and practice is essential to building a quality education system. Although the body of research on educational leadership preparation and development in the US is growing, much more work is needed. The same is true in other countries. To date there has been little systematic or longitudinal work. Furthermore, what we know is based on a limited set of methodological approaches: descriptive, survey and cross-sectional methods. While there are important insights that can be gleaned from such work, particularly in the development of program innovations, they reveal less about what works and why. This should be viewed as an opportunity to develop a serious international research agenda that can contribute to the understanding of effective leadership in a variety of contexts, the design of leadership preparation and development, and the formation of policies that support them.

This article reviews promising pedagogical strategies for the initial and ongoing development of school leaders in such widely different settings as universities, schools, districts, networks and regional development centers. While [Cosner \(2020\)](#) has recently lamented “the dearth of existing literature that attends to pedagogical approaches for educational leadership” ([Cosner, 2020](#), p. 167), an exclusive focus on the educational leadership literature for such approaches is unnecessary, especially since so much of it is descriptive and normative ([Crow and Whiteman, 2016](#); [Hallinger and Bridges, 2017](#)). This review points to an extensive and quite relevant literature about pedagogies for leadership development carried out in both school and non-school sectors. Emphasis in the review is placed on evaluative (rather than descriptive and normative) literature, especially systematic syntheses when they are available.

Framework

The objectives for leadership education are the skills (behaviors, practices), dispositions and specialized professional knowledge needed to be successful as a leader. As [Table 1](#) indicates, underlying processes explaining the acquisition of leadership skills, dispositions and knowledge are described in the paper, along with evidence about promising pedagogical strategies fostering such acquisition. Theories of expertise and how it develops are invoked to explain the achievement of skills objectives (e.g., [Chi et al., 2014](#)). Elements of socio-psychological theory are used to explain the development of several types of dispositions (e.g., [Mayer et al., 2004](#)) and social construction cognitive theory provides the perspective selected for explaining the achievement of knowledge objectives (e.g., [Schunk, 2012](#)). While some pedagogical strategies are much better suited to developing one of the three types of capacities, others can be useful in accomplishing several types of such capacities depending on how the strategies are implemented.

No matter the category of objective for leaders' learning, a large and persistent challenge faced by leadership development initiatives is to increase the likelihood that participants will apply what they learn in their own work settings ([Moldoveanu and Narayandas, 2019](#)). This “transfer of learning” challenge is addressed in the final section of the paper. Throughout the paper, examples of leadership skills, knowledge and dispositions are used to illustrate the focus of pedagogical strategies being described. These

Table 1 Summary of framework.

<i>Objectives for leader education</i>	<i>Underlying processes</i>	<i>Pedagogical strategies</i>
Skills (procedural knowledge)	Development of expertise	• Case study • Problem based learning • Coaching/Mentoring

illustrations are drawn from a well-developed leadership framework (e.g., [Leithwood, 2012](#)) and several recent extensions of that framework (e.g., [Leithwood et al., 2017](#); [Leithwood, in 2021a](#)) including a version aimed at providing more specific guidance to school leaders about how to significantly improve equity in their schools ([Leithwood, 2021 b,c](#)). Although used only for illustrative purposes in this paper, adherence to a consistent framework or model of leadership has been identified as a key feature of especially effective leadership education initiatives ([Darling-Hammond et al., 2020](#)).

Leadership skills

The leadership framework from which illustrations are drawn includes a total of 22 relatively specific skills or practices organized into five domains including setting directions, developing people, designing the organization, improving the instructional program and securing accountability. One recent study ([Leithwood, Sun & Schumacker., 2020](#)) found that, after controlling for SES, this set of school leadership practices explained up to 35.8% of the variance in student achievement depending on the choice of mediator included in the analysis.

Underlying processes

The foundation of a person's performance of a skill (e.g., execution of a leadership practice) is "procedural" knowledge. Such knowledge is stored in memory as, for example, a list of things to do and a sequence about when to do them. By way of illustration, consider the leadership skill or practice "Creating high performance expectations among staff", a specific skill or practice included as part of the domain "Setting Directions". While high performance expectations do not define the substance of organizational goals

or directions, they signal the degree of effort expected to accomplish those goals, and the level of performance associated with the goals (e.g., achievement of the goals by all students not just some).

Now imagine a principal new to a school serving a high proportion of students from economically disadvantaged families struggling to make ends meet. After a few months in the school, the principal comes to appreciate that most staff members care a great deal about their students, spend considerable time offering students social support and know the family circumstances of their student very well. Most staff members are also defensive about the relatively low academic achievement of these students but believe their paramount responsibility is for their students' social and emotional well-being. The principal believes, however, that the long-term well-being of these students is closely linked to their academic success and sets out to increase staff expectations for such achievement.

Among several of the elements of the skill included for this principal in "creating high performance expectations" are helping staff understand and eventually agree on the long-term value of their students' academic success, helping staff identify instructional strategies with the potential to improve their students' academic success and providing constructive feedback to staff about how well those practices are being implemented. Each of these elements contains its own set of more specific skills and each can be enacted with more or less expertise.

So, improving a novice learners' skill (e.g., DeKeyser, 2015) requires pedagogical processes that include opportunities for the learner to acquire initial rudimentary understandings of the elements entailed in performing the skill, as well as the order of performance of those elements when order might be important (procedural knowledge). Learners then need opportunities to perform the skill, guided by those initial, rudimentary understandings of what is involved. Repeated cycles of feedback and performance gradually improve learners' understandings of what is entailed in performing the skill, as well as their performance of the skill, until such understandings and performances approximate those who are at least competent at the skill.

Moving especially from competent to expert levels of skill depends on time spent in deliberate practice (Ericsson, 2006) focused on those aspect of a skill one is weakest at performing. Deliberate practice requires concentration and practice beyond the point of being able to concentrate does not do much to advance one's expertise. Furthermore, as expertise increases over time there is a tendency for skills to become automated and consciously unavailable to the learner for further improvement. So, achieving high levels of expertise also depends on the motivation to continue achieving ever higher levels of expertise (Ryan and Deci, 2012) and the ability (or access to help) to retrieve and monitor one's performance. High levels of expertise also depend on the learners' self-regulation of their own responses to that performance (Leithwood and Steinbach, 1995), that is their ability to "systematically focus on their thoughts, feelings and action on the attainment of their goals" (Zimmerman, 2000).

Pedagogical strategies for enhancing leaders' skills

Expertise enhancement strategies aim to provide learners with positive examples of expert performance and opportunities for practice and refinement of both procedural knowledge and its enactment. There is considerable evidence about the nature and effects of three types of expertise enhancement strategies. One of these types, mentoring/coaching, enable individual practice and feedback in the learner's own context. Two of the strategies, case study and problem-based learning (PBL), can be used with groups of learners and address the significant challenge, in real school settings, of providing learners with opportunities for repeated cycles of practice and feedback. Dexter et al. (2020) argue that the uses of cases and simulations like PBL:

can serve as imagined contexts for practice onto which students can project what they are learning in courses. Rich, complex contexts allow instructors to guide experiential learning, but in a fail-safe way, and to contrive critical or even rare emergency situations ... Feedback about hypothetical contexts can be authentic and constructive, in addition to being research based, without being traumatizing (p. 176)

Case study

Evidence indicates that the structured use of case studies can be an excellent method for building skills or "procedural" knowledge (e.g., how to solve a problem). Many effective leadership programs use these types of techniques to foster their participants' deep engagement with program content of several types (Davis and Darling-Hammond, 2012). The use of case studies is a staple of most business programs and is now common in many educational leadership programs, as well. The US educational leadership community has created the *Journal of Cases in Educational Leadership* devoted to the provision of cases that can be used for such purposes with educational leaders.

Problem-based learning (PBL)

Problem-based learning is also increasingly used for leadership education and evidence suggests that its effects are at least moderately positive (Cosner et al., 2015; Dochy et al., 2003; Hallinger and Bridges, 2017). Most approaches to PBL depend on the prior development of carefully structured cases and include contextual and other forms of information key to problem solution. At their best, those structured cases closely approximate the circumstances faced by leaders engaging with them as a means of prompting transfer to participants' own work settings.

Hallinger and Bridges have provided the most comprehensive account to date about the uses of PBL in the preparation of educational leaders. This account also provides a model, including six fundamental characteristics, of problem-based learning that have been used in many of the applications of PBL for educational leadership development (Hallinger and Bridges (2017), p. 257).

1. The starting point for learning is a problem, not a theory.
2. Learning is stimulated by and organized around a high impact problem that students are apt to face in the workplace.
3. Curriculum units are organized around problems rather than subject disciplines.
4. Students assume major responsibility for managing their own learning in teams.
5. Most learning occurs in the context of student-directed small groups rather than teacher-directed lectures.
6. To the extent practical, students “demonstrate” simulated solutions to the problem (rather than just analyses) and receive formative feed-back on their efforts

Coaching and mentoring

Coaching and mentoring are typically considered overlapping strategies. Evidence suggests that some forms of individual coaching and mentoring significantly influence individual learning, especially feedback provided by coaches about leaders’ work in their schools (Bickman et al., 2012). In spite of their value, Damore and Stacy Rieckoff (2021) report few job-embedded coaching opportunities available especially for experienced US school leaders. A recent comprehensive review of cross-sector executive coaching literature (Athanasopoulou and Dopson, 2018) reported such positive outcomes for those being coached as better personal management skills and self-control, improved leadership skills, more productive interpersonal relationships as well as improved organization-level outcomes. Positive feedback about one’s leadership potential has also been associated with subsequent ambition to become a leader as well as enhanced performance (Steffens et al., 2018).

Coaches are also valuable resources for learning that takes place in the context of teams and networks (Rapp et al., 2016; Ford et al., 2013). One purpose for a coach in these contexts is to act as an advisor to network members specifically aimed at improving the quality of network interactions. A second purpose is to work with individual program or network participants on their own problems of practice within a networked arrangement (Ely et al., 2010).

Evidence reported by Hamlin and Sage (2011) indicates that mentors (and likely coaches) value mentees who are open, friendly and receptive, take responsibility for their own learning and for the success of the mentoring relationship and reveal their concerns and provide feedback on the impact the mentoring is having. Mentors also value mentees who help their mentors to understand quickly both the individual and organizational contextual factors that impact positively or negatively on the mentoring situation.

Mentees appreciate their mentors when they build an open and mutually trusting dyadic relationship that leads to friendship and convey positive regard for mentees and induce in them self-reliance, self-esteem and confirmation” of self-worth. A “coaching” style of mentoring is appreciated by mentees as are mentoring processes that take mentors outside their comfort zone so they can learn to cope effectively with more challenging work assignments.

Feedback can be provided to individual learners other than through coaching and mentoring, however. Individuals receive feedback when they compare their actual performance with their understanding (or schema) of ideal performance. This feedback is always available to the individual, although not always taken advantage of. But the value of this feedback is limited by the sophistication of their own understanding and the extent to which they are able to monitor their own performance. Feedback from a relatively expert coach or mentor overcomes both of these limitations. At its core, the coach or mentor’s feedback is based on his or her assessment of the gap between the participant’s performance and the coach or mentor’s more refined understanding of what an expert performance should look like.

Leadership dispositions

The framework from which illustrations are drawn about leadership dispositions includes two categories of such dispositions. Socio-emotional and psychological dispositions.¹ Underlying processes giving rise to these two sets of dispositions are partly different from one another, and some of those processes depend on the development of expertise (described in the previous section) as well as propositional knowledge (described in the next section).

Many dispositions, in addition to the two sets included in the illustrative framework, have been included in both leadership programs and the standards on which some are based. However, there is little consensus about either the meaning of “dispositions” or which dispositions matter most.

Social emotional dispositions

Underlying processes

Social-emotional dispositions, conceived of as “abilities” (Daus and Ashkanasy, 2005), include perceiving and managing emotions, as well as acting in emotionally appropriate ways. Reflecting the dimensions of emotional intelligence included in Mayer et al.,

¹Recent refinements to the framework include “Character” as a third category of dispositions, one encompassing leaders’ values and the use of those values in ethical decision making. Underlying processes and pedagogical strategies for developing leaders’ Character will be addressed in a subsequent paper.

(2004) influential framework, these social emotional dispositions are strongly associated with such leadership-relevant outcomes as job satisfaction, improved management and coaching skills, teamwork and conflict management ability, along with positive attitudes toward work (Little et al., 2016; Kotsou et al., 2019). Relationships such as these are especially significant for those in jobs with relatively high levels of emotional labor such as school leadership. There is broad consensus about the improvability of at least some of these abilities (Dulewicz and Higgs, 2004), although interventions are generally believed to be most effective during childhood. Underlying processes accounting for improvements are adaptations of the skill development processes leading to greater expertise.

Pedagogical strategies

Adopting skill development as the process underlying social emotional learning means that case study, PBL, coaching and feedback are suitable pedagogical strategies for the socio-emotional development of leaders (Green et al., 2011). Cherniss et al. (1998) point to elements of the skill development process especially significant for developing this set of dispositions. Pedagogical strategies should be especially clear about the goals to be achieved:

Specific and challenging goals help support social and emotional learning because they maximize self-efficacy, mastery, and motivation. (p. 17)

These strategies should also maximize practice opportunities:

In social and emotional learning, there often must be more practice than in other types of learning because old, ineffective neural connections need to be weakened and new, more effective ones established. Such a process requires repetition over a prolonged period of time. And learners need to practice on the job, not just in the training situation, for transfer to occur." (p. 17)

Especially frequent feedback on practice should be provided:

Feedback is especially useful in social and emotional learning because the learners often have trouble recognizing how their social and emotional behavior manifests itself. In fact, because self-awareness is a core competence, those who need the most help in emotional competence programs may be particularly weak in this area. (p. 17).

And experiential methods are much to be preferred in developing socio emotional skills:

More active, concrete, experiential methods, such as role plays, group discussions, and simulations, usually work better than lecturing or assigned reading for social and emotional learning. In order to re-program neural circuits connecting the amygdala and neocortex, people need to actually engage in the desired pattern of thought, feeling, and action. (p. 18)

Evidence suggests that strategies for increasing leaders' sensitivity to their own and others' emotions include coaching and feedback for recognizing the emotions of self and others from facial and voice cues, as well as awareness of one's own body states relating to emotions. Also recommended is coaching about how to adjust the overt expression of leaders' own emotions so they are appropriate to the circumstances, and how to draw on positive moods to enhance creative thought (e.g., Schutte et al., 2013).

Psychological dispositions

Underlying processes

Four psychological dispositions, included in the illustrative leadership framework, are associated especially strongly with more efficacious leadership including optimism (Kluemper et al., 2009), resilience (Foerster and Duchek, 2018) self-efficacy (Leithwood and Jantzi, 2008) and proactivity (Crant and Bateman, 2000). Underlying processes giving rise to these psychological dispositions are explained by a line of theorizing in social psychology about the self-regulation of behavior (e.g., Bandura, 1991).

Self-regulation theory explains high levels performance as a virtuous circle of self-beliefs influenced by the setting of ambitious goals, attention to feedback about progress in achieving those goals (Schier and Carver, 1992) and belief that most capacities can be learned, Dweck's "growth mindset" (2007). People who believe that achieving ambitious outcomes is possible and likely (optimism), as well as something they have or can acquire the ability to achieve (role-specific self-efficacy), continue to pursue those outcomes even in the face of adversity (resilience). Closely related psychological dispositions, optimism, self-efficacy and resilience, have their most powerful effect on a person's behaviors acting in unison to promote "proactivity". Proactivity is a motivational state

predisposing a person toward initiating future-oriented action to improve organizational functioning (Parker et al., 2006; Crant and Bateman, 2000).

Pedagogical strategies

Consistent with self-regulation theory, Bandura et al. (1999) identified four types of learning experiences on which to base leadership education strategies aimed at enhancing psychological dispositions. Although not pedagogical strategies themselves, these four types of experiences mediate the influence of pedagogical strategies on the learning of leaders. The four types of experiences are described in this section along with examples of pedagogical strategies likely to stimulate each type of experience.

Mastery experiences

Leaders' past successes and failures with a task will have strong effects on their feelings of optimism and self-efficacy about accomplishing similar future tasks. These mastery experiences might arise for example, from participation in some form of especially relevant district professional development or from opportunities to solve manageable problems in their schools, as when a principal asks a teacher leader to chair a school committee and supports their efforts to do so. Evidence reported by Rafferty and Griffin (2006) found that "mastery experiences have a stronger impact on efficacy beliefs than other factors ... such as vicarious experiences, cognitive simulations, verbal persuasion or physiological and affective state. (p. 56). Self-regulation theory also points to strong efficacy beliefs as a key point of departure for the for eventual achievement of ambitious goals.

Vicarious experiences

Visualization of successful performance may serve as vicarious experience and be prompted by observing a skilled model (e.g., another leader working in a similar context) or by hearing about how other leaders have successfully accomplished relevant tasks in their own contexts. Self-regulation theory endorses exposure of learners to models who demonstrate the importance of resilience in accomplishing ambitious outcomes. Well-functioning peer networks offer considerable potential for vicarious experiences such as these, as well as opportunities for the information-rich feedback so essential for skill development (Leithwood, 2018).

Verbal persuasion

This source of stimulation includes encouragement and feedback from a credible, trusted, and respected colleague (perhaps a coach or mentor). Self-regulation theory points to verbal persuasion as among the most obvious and promising ways of persuading learners that they are able to learn novel (to them) and complex leadership skills – a "growth mindset", to use Dweck (2007) term. Transformational models of leadership encompass the provision of such persuasion in a practice labeled "individualized support" (Rafferty and Griffin, 2006). Evidence from non-education sectors also associate individualized support with increases in self-efficacy and employee optimism, as well (Rich, 1999).

Emotional arousal

This is a form of enhanced motivation that may be triggered by an inspirational other, a charismatic senior leader for example, who helps elevate other learners' standards and aspirations and helps them see the relationship between their organization's goals and larger social and moral purposes. A compelling speech about, or model of, those elevated standards might provide such inspiration. Some evidence (Rodríguez-Sánchez et al., 2019) indicates that clarifying an organization's commitment to social responsibility makes significant contributions to employee resilience. Elevated aspirations and more fundamental purposes are compelling reasons for "staying the course".

Leadership knowledge and understanding

The framework from which illustrations are drawn does not aspire to capture all that a leader needs to know and understand. Rather, the focus is primarily on the "mediators" of leadership influence on students, that is, those in-school and out-of-school conditions that are known to have relatively direct positive effects on students *and* that are amenable to intervention by school leaders (Sun and Leithwood, 2017). Knowledge about such mediating conditions allows leaders to focus their improvement efforts on diagnosing and enhancing the status of those conditions that matter most to student success. Acting on this knowledge is the practical consequence of understanding that the majority of a school leader's influence on students is indirect (e.g., Sebastian and Allensworth, 2012).

The illustrative framework identifies four categories of mediating conditions, a dozen in total, all justified by considerable previous research (Leithwood, Sun & Pollock). One recent study (Leithwood et al., 2020) found especially strong influences on student achievement of one of the four categories of mediators ("rational") including academic press, disciplinary climate and teachers' uses of instructional time.

Underlying processes

An earlier section of this paper described “procedural” knowledge (knowledge about how to do something) as the foundation of skill development. Leaders’ understanding, on the other hand, depends on a type of knowledge often referred to as “propositional” or “declarative”; this is knowledge about something² – it is factual and conceptual in nature.

Social construction theory, especially dialectical approaches to it, is used here to explain how propositional knowledge is developed. While rote learning will sometimes be sufficient to acquire new facts, acquiring more complex forms of new propositional knowledge depends on learners making connections between what they already know and the new ideas or concepts to be learned (Bransford et al., 2004). This process entails learners accommodating what they already know by adapting or changing it in a way that makes sense to them in the context of the settings in which they find themselves (Schunk, 2012). A personal level of understanding of new concepts or ideas is acquired through such processes: this is a social constructivist interpretation of “true beliefs”.

Piagetian notions about intellectual development suggest that, in the face of potentially new ideas, the mind’s default response is to attempt to assimilate them into one’s existing understandings avoiding the hard work of restructuring or adding to one’s existing understandings (Block, 1982). The hard work of accommodating new knowledge is prompted by challenges to existing ways of understanding, clear definitions and explanations, as well as by experiences that distinguish new concepts and ideas from already understood concepts and ideas.

Pedagogical strategies

Social construction learning theory itself *rules out* very few specific forms of pedagogy. The main focus of the theory is not on pedagogical strategies but on learners’ responses to those strategies. Any strategy that results in learners’ actively processing concepts and ideas and actively working to make sense of them will do. Two routinely but mistakenly criticized strategies exemplify this key point.

Lectures/discussions and other forms of information presentation

Information-based strategies such as lectures, lectures combined with discussion and a wide array of digital presentation modes are often considered passive forms of information transmission ineffective in promoting learners’ active processing (e.g., Dexter et al., 2020). Meta-analytic reviews of evidence in the non-education sector, however, indicate that lectures or lectures followed by discussion make substantial contributions to participants’ propositional learning (Lacerenza et al., 2017; Collins and Holton, 2004). The bad press about lectures, for example, is really bad press about bad lectures. As most of us know through our own experience, a lecture from an engaging person about new ideas that, for example, challenge our existing understandings or offer new perspectives on familiar issues can prompt a great deal of sense-making on our parts. We have all witnessed very engaging TED talks, for example. The “good” lecture is actually a very efficient way of instilling propositional knowledge as well as encouraging transfer of knowledge use to other settings.

Individual reading

Some quite recent evidence has indicated that many school leaders rank their personal reading as the most valuable source of their own professional knowledge (Leithwood, 2018). Individual reading also offers the potential to infuse new knowledge into network interactions as a means of stimulating collective knowledge creation. Leadership education initiatives can capitalize on the value of their participants’ individual reading by providing them with a carefully curated set of readings designed for two purposes. One purpose of these readings is to present basic information related to the content of a leadership education initiative. Readings may also serve as points of reference for helping participants to become more sophisticated and habitual consumers of research, an important long-term goal that an effective leadership education initiative might aim to accomplish.

Program readings can fall short of their potential for several reasons. Johnson (2014) provides a list of ways this can happen, as well as how to ensure that they do not. Many participants are reluctant to read original research reports, often the most authentic sources of relevant ideas (Darling-Hammond et al., 2010) because of difficulties in understanding complex data analysis techniques. Ensuring participants that all readings of this sort are based on credible techniques that they need not spend time on is an easy way to overcome some of this reluctance (admittedly this minimizes the development of some of the skills ideally needed to be a sophisticated long-term consumer of research). Avoiding readings that provide very small returns of ideas or stimulation for the time it costs to read them is another method for encouraging personal reading of individual program participants. Spending significant time in networks and other program forums discussing the assigned readings helps to signify and unpack their value to participants.³

²Philosophers such as Moser (1987), for example, argue that the conditions for claiming to have propositional knowledge about something include “justified true belief” and spend a lot of their time arguing about whether those conditions are sufficient. “Propositional” knowledge, as it is used in this paper, does not depend on wading into these arguments. Suffice to say that the propositional knowledge included in the illustrative framework includes an understanding of the concepts representing the mediators of leadership influence. Robust empirical research about each of the mediators justifies the argument that they deserve the attention of leaders’ school improvement efforts. The leadership education challenge is to help leaders understand the concepts and the empirical justification of claims that they matter to students.

³Some of the claims in this paragraph reflect my own experiences delivering leadership development programs over many years; it is not based on other more formal evidence unless cited.

Multi-use pedagogical strategies

The description, to this point, about how to improve leaders' skills, dispositions and knowledge indicates considerable overlap among categories of pedagogies useful for improving a wide range of leaders' capacities. For such pedagogies to be so broadly useful, however, those responsible for leadership education need to be highly intentional in the application of the pedagogies. In addition to such overlap, some pedagogical strategies can be useful no matter the objectives or content to be learned. Four approaches not yet touched on are described in this section of the paper.

Needs analysis

Because much of the leadership development research in the education sector is concerned with the impact of whole programs, it has provided very little evidence about the value of needs analysis, at least at the individual level. Reviews of non-education sector research (e.g., [Collins and Holton, 2004](#)), however, suggest that needs analysis is a useful tool for personalizing leadership development; avoiding wasting participants' time on skills and knowledge they either do not need or already possess. Absent such an analysis, programs are more likely to be generic in nature and not suitable for at least a portion of individuals and their organizations. Needs analysis, however, needs to guard against relying solely on participants' existing understandings of what they should learn ([Ford et al., 2013](#)). There is an important role for some form of coaching in this process.

Digital technology

Digital technology now permits the ready presentation of new information online, along with interactions among participants about the meaning and use of that information. One recent study found that 73% of the leadership preparation programs sampled by the study used some form of distance learning ([Crow and Whiteman, 2016](#)). Webinars have become a core strategy of some organizations (likely most organizations during the pandemic) for introducing program content to participants and for engaging participants in sense making about such content. Online strategies such as these are replacing the heavy use of seminar and lecture formats traditionally used for the presentation of new ideas, although a small number of face-to-face sessions are still likely to be useful. While face-to-face experiences provide immediate flexibility in response to participants' concerns, they can also be a forum in which the voices and views of some members dominate those of others. Online provision is noted for leveling the opportunities to be heard by all members ([Barakat et al., 2019](#)) but for this to happen, discussions need to be carefully moderated.

Evidence and theory from research on e-leadership, especially the leadership of virtual teams, has some implications for the use of digital technologies as tools for leadership education. Two lines of theory seem especially useful to consider. One line of theory, media synchronicity theory, distinguishes synchronous from asynchronous forms of digital communication. Face-to-face, phone conversation and videoconferencing are examples of synchronous communication, while text and email are asynchronous examples. The flow of conversation is controlled by the degree to which a digital medium allows for synchronous communication, as in the case in face-to-face communication.

A second line of theory, media richness theory, is explained as follows:

A rich medium allows for: (1) transmitting multiple verbal and nonverbal cues, (2) using natural language, (3) providing immediate feedback, and (4) conveying personal feelings and emotions ... The richest medium is [face-to-face] communication, followed by telephone, chat, e-mail, and print communications. Newer technologies, such as videoconference, are thought to rank above the telephone, but below FTF communication in terms of media richness

Hambley et al., 2007, p. 3.

While some comparative evidence indicates that participants rate the learning that occurs through online and face-to-face program experiences about the same (e.g., [Ritter et al., 2010](#)), evidence and theory about e-leadership suggest more nuanced leadership education applications; that is, as the complexity of what is to be learned increases, so should the synchronicity and richness of the media used.

Writing about corporate sector leadership development, [Moldoveanu and Narayandas \(2019\)](#) argue for corporations to conceptualize the huge range of forms and providers available to them as a *Professional Learning Cloud* (PLC). As technology becomes increasingly used by providers and increasingly sophisticated (e.g., media rich and synchronous) in how it engages learners, both corporations and individual learners will be able construct professional learning experiences that are increasingly personalized, social and contextual in nature. These experiences will also potentially be much more cost effective to the extent that the content of many traditional programs becomes accessible in a piecemeal fashion. The potential for Artificial Intelligence, now being actively applied to assist learning for K-12 students ([CoSN and Microsoft, 2020](#)) will, no doubt, begin to emerge as a more prominent tool for leadership development in the near future.

Corporate sector professional learning opportunities would seem to be significantly greater and more varied than are learning opportunities for educational leaders. But developing a *Professional Learning Cloud* for educational leadership development would be a promising initiative.

Cohort and network structures

Many highly regarded leadership programs promote collegial communities or networks that have a sustained focus and clear expectations for improved student engagement and learning outcomes. The motivation of members in collegial communities to engage actively in their own learning is typically very high. Many effective leadership development programs now create collegial communities by developing peer networks among participants sometimes by organizing participants in cohorts which continue together throughout their program experiences (e.g., Ford et al., 2013).

Whether through cohort organization or in some other manner, effective peer networks can vary in size and members may interact both in person and online. Principals included in two recent studies (Leithwood and Azah, 2016; Leithwood, 2018) ranked participation in their district-developed peer leadership networks as second only to their own professional reading as a source of their professional learning among a dozen possible sources.

A well-functioning network builds on strong interpersonal relationships (e.g., Gallego et al., 2001) and contributes to the capacity of individual members by exposing them to the practices, dispositions and ideas of others faced with similar tasks and responsibilities (e.g., Lieberman and Grolnick, 1996). This is the diffusion goal of networks, one that exploits knowledge already developed by ensuring that such knowledge goes to scale. The diffusion process often also encourages network members to make explicit, for themselves and their colleagues, the large amounts of tacit knowledge (Polanyi, 1983) on which a large proportion of their expertise depends.

A network is also a structure which, under the right conditions, stimulates potentially rich interactions among members resulting in new and creative ideas or practices not initially part of the repertoire of any individual network member (e.g., Lieberman and Grolnick, 1996). The whole becomes more than the sum of its parts. This is the knowledge creation goal of networks. Knowledge creation depends on meeting at least four closely related conditions:

- willingness on the part of participants to collaborate in the solving of some shared problem or the meeting of a shared purpose
- willingness, during collaborative interactions, to genuinely listen to the ideas of one's network colleagues. Such listening entails a conscious change in mindset, from one that is primarily about assimilation of new ideas to one that is focused on the adaptation of one's existing understandings
- emergence of solutions or ideas that are not simply personally creative (individual learning) but are creative or novel and useful to the collaborating groups, as a whole
- infusion of relevant ideas located in sources outside the network.

University-district/school partnerships

Anderson et al.'s (2018) study of leadership programs affiliated with the *University Council for Educational Administration* (UCEA) found that among the 97 sampled programs, a very large proportion were actively engaged in formalized partnerships with districts. Examples of the advantages ascribed to such university-district/school partnerships include bridging theory and practice, creating more options for delivering programs, emphasizing collaborative leadership, aligning district and program goals, and sharing of program costs. Some evidence also points to improved program quality and increased opportunities for districts to develop leaders with the capacities needed to help districts achieve their strategic priorities. University-district/school partnerships, however, bring with them their own challenges. Perhaps the largest of those challenges is obtaining and maintaining sustained participation and commitment from all stakeholders, often a challenge in the face of rapid district leadership mobility and succession (Crow and Whiteman, 2016; Darling-Hammond et al., 2010).

A recent, large-scale UK study (Day et al., 2021) unpacked how university-school partnerships may contribute to fundamental and sustained large-scale educational reform and the conditions needed for those contributions to be realized. Insights from this study also include how and under what conditions such partnerships are likely to contribute to leadership development. Partnerships offer most of the advantages to leaders' learning described in the previous account of peer network participation. However, as compared with peer networks for example, university-school partnerships are likely to encompass much greater diversity of knowledge, culture, perspectives on challenges for improvement and resources. As the authors claim:

The joining of resources, knowledge, experiences and expertise creates a larger entity that can potentially expand the capacity of each individual partner and offer them the promise of deep change and improvement through trustful collaboration. (p. 127)

Learning through participating in university-school partnerships would seem to depend on leaders: treating the diversities to be found in partnerships as opportunities for improving their own capacities; welcoming the opportunities for collaboration with different "others"; contributing to the development of trusting, productive working relationships among members of the partnership and: readily engaging with others in the partnership to build new knowledge.

Transfer of learning

Transfer of learning occurs when learning in one context has a positive or negative influence on a person's performance in another context. The transfer process is generally considered to be challenging and unlikely to occur unless specific strategies are used to

encourage it. Failure to transfer learning from a leadership education experience to a learner's own work setting is a major threat to the impact of leadership development initiatives (Moldoveanu and Narayandas, 2019). The often-significant investments in those initiatives can easily result in little or no return. For this reason, no matter the category of objective being addressed by a leadership education initiative, including strategies to help ensure transfer of learning to participants' own work settings should be considered a basic requirement.

The seminal work of Perkins and Salomon initiated three decades ago (Perkins and Salomon, 1992; Salomon and Perkins, 1989; Perkins and Salomon, 1989) helps clarify the transfer of learning process and identify basic strategies for helping to ensure it. A key distinction introduced by these researchers is between near or "low road" transfer and far or "high road" transfer. An example of low road transfer would be a school leader applying a goal-setting procedure she developed in one school to a new school to which she had been transferred. The basic procedure might remain the same but the explanation of it to the different group of teachers in the new school might have to be modified. This low road transfer process is reflexive, that is, it involves the triggering of well-practiced routines under conditions that are similar to those in the original learning context.

The best case for leaders to learn from to ensure low road transfer will often be their own school or district, the challenges it faces and the many features that make it different from other schools or districts. Using the example of one leadership development program in Texas (Rice University's Educational Entrepreneurial program), immersing participants in their own cases entailed program providers collecting evidence in the early stages of participants' engagement in the program about key aspects of each participant's school. This evidence, summarized into readily useable form by program staff, was fed back to each participant in a report used as a major resource for school improvement work. Knowledge and skills about leadership for school improvement were important elements of the program's content. Participants' guided efforts to improve their own schools were a central strategy used by this program to foster development of such knowledge and skills (also see Salisbury and Irby, 2020).

High road transfer entails the application of learning that occurred in one context to inform performance in a very different context. An example of high road transfer would be an approach to stimulating staff innovation described in a case study of a high-tech company included in a training program attended by a superintendent of education. For the superintendent to apply this case to encourage innovation among school leaders in his or her district the superintendent would need to work quite deliberately at understanding the fundamental ideas used by the high-tech company to prompt more staff innovation and to have sorted out the differences in contexts that would need to be addressed for successful application in his or her own district. Perkins and Solomon refer to this process as "deliberate effortful abstraction and a search for connections" (Perkins and Salomon, 1992; p. 8). Examples of strategies for improving the chances of successful high road transfer include:

- explicit abstractions of principles from the original learning situation
- metacognitive reflection on the part of learners to their own thinking
- use of metaphors and analogies during the original learning experience.

While evidence indicates a much greater likelihood of low road, as compared with high road transfer, the value of successful high road transfer is its flexible use across multiple contexts. Low road transfer of learning, in contrast, is limited to applications in very similar circumstances. Successful low road transfer cannot be taken for granted, however. It requires the learning, which is to be transferred, to be well automated, something typically requiring significant practice. It also requires the context for transfer to be very similar to the context of the original learning.

Conclusion

The article has provided evidence to justify three basic claims central to the goals for leadership development and their achievement. First, almost all leadership capacities can be conceptualized as either skills, dispositions, or knowledge and understanding. Second, development of each type of capacity can be explained by at least partly distinctly bodies of theory, for example, theories of expertise in the case of skills, self-regulation theory in the case of many dispositions and social constructivism in the case of knowledge and understanding. Each of these bodies of theory, thirdly, provide useful guidance when selecting and implementing pedagogical strategies for use in leadership education initiatives. Some pedagogical strategies have the potential for helping achieve multiple types of leadership capacities depending on *how* they are used. Leadership educators are advised to be highly intentional about the capacities to be developed when implementing most of the more than dozen strategies described in the paper and not to rely on just one strategy (Lacerenza et al., 2017).

Some common understandings of the term "active learning strategies" (e.g., Dexter, et al., 2020; Salisbury and Irby, 2020), used in more recent leadership education programs, have been challenged in the article. In descriptions of these programs, the term "active" does seem to describe the physical and social circumstances of participants; for example, they are working on problems with others and engaged in networking activity. But active *instructional* strategies would be a more accurate label for them. Whether or not participants are actively *learning* depends entirely on whether they are cognitively and/or emotionally engaged in making sense of their experiences. While such engagement does seem likely with many of these active instructional strategies, participants can be engaged in making sense of their experiences by well implemented learning strategies (a lecture, for example) often viewed as passive or simply designed to transmit information.

The article also acknowledges the waste of resources that occur when leaders acquire new skills, dispositions, and knowledge through participation in a learning initiative but subsequently fail to use those new capacities in their actual work. Transfer of

learning theory has been invoked as a source of guidance for leader educators about how to design their education initiatives to better ensure use of new learning in practice. The important distinction in transfer of learning theory between “high” and “low-road” transfer also helps to both explain and challenge the types of educational initiatives preferred by many practicing leaders. These preferred initiatives typically stress low-road transfer because they offer relatively immediate “practical” solutions to current problems and require relatively small amounts of cognitive accommodation on the part of learners. But many of the challenges facing today’s educational leaders in the future will be predictably unpredictable, guaranteed only to be significantly different than the challenges they currently face. Preparing school leaders for such unpredictable futures is the job of “high road” transfer – arming today’s leaders with powerful theories, principles and concepts that can be used as tools for addressing many different future circumstances should be an important feature of educational leader education today.

Introduction

International research (e.g., [Huber, 2010](#); [Day and Sammons, 2013](#); [Day and Gurr, 2016](#)) consistently shows that highly successful principals and headteachers demonstrate a number of personal and professional characteristics. They are optimistic, enthusiastic and curious, committed to social justice, equity and excellence, and they show respect and empathy for others. Self-aware, resilient and persistent, they show drive and determination, enthusiasm, courage, conviction and integrity in pursuing excellence and putting students first. Only the best will do for such professionals. Similarly, [Lovett et al., \(2015, p. 138\)](#) note that there is general agreement that “school leaders need high levels of self-efficacy, resilience, self-awareness and judgment in order to cope with the emotional demands and complexities inherent in school-based ethical decision-making”.

Research evidence also shows that given the intensity of the job, the emotional demands, the accompanying workload and the high-stakes accountability cultures in which they work, principals suffer from high levels of occupational stress ([Bakker, 2015](#); [OECD, 2013](#); [Phillips and Sen, 2011](#)). It is perhaps unsurprising therefore that many education systems are experiencing difficulties in recruiting and retaining school principals ([Cheng and Szeto, 2016](#); [Fink, 2010](#); [MacBeath, 2009](#); [MacBeath et al., 2012](#); [OECD, 2009](#); [Pollock, 2016](#); [Thomson, 2009](#)). In England, “The School Leadership Challenge” ([Future Leaders Trust, 2016](#)) provided an analysis of the supply and demand for school leaders until 2022. It noted that schools in England face real challenges in attracting, developing and retaining leaders. The research found 40% of school governing bodies, who are responsible for the appointment of heads, face challenges in finding good candidates for senior roles.

Within this context of recruitment and retention challenges, growing emotional demands, work intensification, stress and overload, this paper considers the personal development needs of school leaders. It argues that while the provision of leadership development opportunities continues to be essential, greater attention needs to be given to individuals and their personal development - their wellbeing and developing the personal qualities and traits required to operate in such demanding working conditions. For as [Mahfouz \(2020, p. 442\)](#) notes, “when school administrators are emotionally exhausted, overworked and fail to prioritize their own wellbeing, they typically become frustrated, and their performance is hindered”.

Consideration is also given to the forms of support needed to ensure leaders’ continuing effective performance, all the more important while working within a high stakes accountability culture. In other words what is needed for headteachers to “survive”, “thrive” and also “revive” (or rejuvenate) in the current educational landscape? Drawing upon evidence from a variety of sources, it is suggested that there is a need for leadership development programmes to give as much if not more prominence to personal development over professional development - what [Waters \(1998a\)](#) calls the “pro-personal” and [Leithwood \(2012\)](#) terms personal leadership resources. Also a number of suggestions are made which will help make the work of principals - both the work itself and the way it is approached - more sustainable and to ensure they continue to operate effectively. If implemented, these suggestions would help principals not only to survive but thrive and/or revive, thus bringing many benefits to the individuals themselves, the schools they lead and the students within them.

Leadership development and leader development

Leadership development refers to the activities involved in strengthening a leader’s ability to establish clear vision and achievable goals, and to motivate others to subscribe to the same vision and goals. Leader development, however, focuses more on the individual school leader and their personal needs, what is sometimes referred to as personal effectiveness or personal efficacy. Broadly

^aA version of this article was published in 2020 as “Surviving, thriving and reviving in leadership: the personal and professional development needs of educational leaders”, *Opinion Piece, Manag. Educ.* 34 (3), pp. 117–121.

speaking, leadership development encompasses all formal and informal learning that enables leaders to improve their own practice while performing the role. It is often focused on developing competences or skill acquisition (Bush, 2018). Leader development is an aspect of personal (leader) development and, wherever possible, the two - leader and leadership development - should interact and complement each other: it is not “an either/or” but “both”. The former is mainly about occupational role development, whereas personal or leader development is about the growth of the individual (the leader), often the “whole” person, and it almost always involves changes in self-awareness and understanding.

Personal development which almost always involves changes in self-awareness (Waters, 1998a) is therefore seen as a fundamental part of the job not an optional extra. Leader development is “above all the development of the individual and only secondarily the development of the role. The premise is that the more we learn about ourselves the better we will perform in our job – a direct consequence the one of the other” (Gray, 1987 cited in Waters, 1998b, p. 32). However, the more common approach to personal development is perhaps best described by Waters’ term “propersonal development”. This is development that is not genuinely “personal” in its focus but is personal development for professional development purposes (Waters, 1998a, p. 35). Tomlinson (2004, p. 1) states, “Personal effectiveness is a precondition of professional excellence” and notes the importance of self-management and self-awareness thus:

Improved self-management increases an education leader’s ability to cope with stress, resolve conflict, manage change and manage to change, achieve sustainable peak performance, build and lead effective teams, and influence organizational cultures (p.1).

In a similar vein, Nicholas and West-Burnham (2016) have argued that although leadership development and training opportunities are more available for leaders than ever before, the bulk of them focus on the technical and the organizational, yet:

There are other dimensions to (leader) sustainability that we believe are being neglected – that is the personal aspects of well-being and wellness. This might be best understood as personal efficacy (i.e., the development of the whole person) – the recognition that leadership is more than an aggregation of technical skills and that it requires the engagement of all aspects of the person (pp. 203–204).

School leaders need to acquire and develop their “intelligences” (e.g., emotional, contextual, strategic) as well as their knowledge and skills (Day and Sammons, 2013). Research, especially into successful and highly effective leaders (e.g., Day and Gurr, 2016) points, *inter alia*, to the importance of whole person development and it reinforces Waters’ exhortation for development which links improved personal management with increased professional efficacy. In 2012 Leithwood introduced the concept of “personal leadership resources” (PLRs) which included cognitive (e.g., problem-solving), social (e.g., acting in emotionally appropriate ways) and psychological resources (e.g., self-efficacy), seeing them as showing “promise of explaining a high proportion of variation in the practices enacted by school leaders” (Leithwood et al., 2020, p. 10).

One of the psychological resources noted by Leithwood was resilience and its importance has been noted in the literature as crucial to individual teacher and leader effectiveness (Beltman et al., 2011; Day and Hong, 2016; Day and Gurr, 2016; Sardar and Galdames, 2017). Although writing only about teachers, Beltman et al. (2011, p. 197) note how resilience is essential to “ensure that those who stay in the profession do not just survive, but thrive as confident and healthy professionals”.

Professional and personal spheres are mutually supportive and beneficial, however, we wish to propose that there is a need for development programmes to give greater prominence to elements of personal development and PLRs, including developing self-awareness, self-efficacy, reflection, managing emotions, wellbeing and resilience, which are even more important as the role of the principal changes and their work becomes ever more demanding and all-consuming.

The challenges of headship

It is known that the work of principals is complex and demanding. Research using observation, diaries and logs completed by headteachers show a relentless, complex and emotionally-demanding workload. An observational study in England (Earley and Bubb, 2013) showed principals spending long hours of demanding, varied and complex work, confirming the commonly-held view of headship as pressured, highly accountable and stressful (Phillips and Sen, 2011). For MacBeath and colleagues a good descriptor of what it means to be a headteacher in the 21st century is “intensification”: “increasing pressure to do more in less time, to be responsive to a greater range of demands from external sources and to meet a greater range of targets, accompanied by impatient deadlines to be met” (2012, p. 422). Fink summed it up well when he said principals were reporting being overburdened, overworked and overwhelmed (2010, p. 35).

The work of school leaders is more complex than ever with many challenges to be met. Examples of these challenges include accountability pressures associated with high-stakes testing; school inspections; league tables and exam performance; curriculum developments; changes in assessment; and human resources issues, such as recruiting quality teachers or maintaining staff morale. The main difficulty, however, is that at any point in time there are always numerous challenges and initiatives that have to be dealt with, often concurrently. For example, as part of a research project conducted for the English independent school sector, when heads

were asked to identify their three most significant challenges from a list of 16 provided by the researchers, one said, “The hard part is that there are never three things. It’s usually about a dozen!” (Earley et al., 2016, p. 10).

The role of school principals has always been demanding but it has changed considerably over recent decades, in particular with regard to the levels and patterns of accountability, the nature of their responsibilities and the extent of institutional autonomy (OECD, 2009; Schleicher, 2012). School autonomy and decentralization policies, found in an increasing number of national education systems, have given new and enhanced powers to school leaders who:

Sit at the fulcrum of high autonomy-high accountability systems and are expected to resolve the policy paradoxes of both competition and co-operation they should: exercise their autonomy to innovate in response to parental needs, whilst at the same time meeting centrally prescribed targets and requirements; improve literacy and numeracy scores every year, whilst maintaining a broad and balanced curriculum; close attainment gaps, while pushing the brightest and the best; and collaborate with their peers to develop skills and capacity, whilst competing to ensure that (their schools) move up the local hierarchy.

(Greany and Earley, 2021a,b, p. 5)

The challenges and demands are many and although they may change they are unlikely to disappear. School leaders, regardless of phase or sector, will need considerable support and on-going development, both professional and personal, if their schools are to provide the kind of education needed for students to live and work in the 21st century.

Across the world headteachers have had to come to terms with heightened expectations and increasing public accountabilities (MacBeath et al., 2012). This is a process that Gronn (2003, p. 147) has called “greedy work”, where school leaders work increasingly in a “high stakes” accountability culture where their job may well depend on the results of their last external school inspection. He comments on the “greedy work” of organizations for leadership in the current educational climate, reflecting the intense and potentially overwhelming nature of modern headship. The all-encompassing nature of headship is also noted by Bottery (2016) when discussing “the threats to leadership sustainability”:

Much of this extra work is hidden from public view in the additional hours at home, not just on weekday evenings but also at weekends and on “holiday”. If leaders do not do this then the job begins to run away from them. So a Catch 22 situation can develop, where work requires unsustainable hours if individuals are to keep on top of it, but where the job becomes unsustainable if they do not. Either route is likely to lead to extra worry and stress, to the four-in-the-morning syndrome, and to less personal sustainability (p. 98).

Similarly, Lee (2016) notes that while the use of technology may be desirable for faster and more efficient organizational communication, “using ICT outside of school and before/after office hours for school work seems to be a sign that principals’ work is adopting the characteristics of a 24/7 ubiquitous service, which commonly occurs in business sectors” (2016, p. 133).

All-consuming workloads and challenges must be seen as surmountable and the leadership task perceived as possible for “ordinary mortals” for organizations to ensure a continuing succession of effective leaders. As the punishing pace of their work increases, school leaders therefore need to be helped to develop confidence in their capabilities and to acquire appropriate knowledge, understanding and skills. They also need to know that they have or can develop the self-awareness, personal resolve and resilience to maintain their wellbeing and work-life balance and, importantly, that they have the support of others.

Research from the OECD (OECD, 2020; Schleicher, 2012) alerts us to the variations in the role and workload of principals in different countries. In England nearly two-thirds (61%) of headteachers described their work-life balance as poor or very poor, due “to long working hours or to deficiencies in working practices, such as school headteachers not knowing how to prioritize or delegate their work” (ibid, p. 18). The Teacher Workload Survey (Walker et al., 2019) found that headteachers on average reported working 56.9 hours in a week in March 2019. Not only is work-life balance desirable, it is increasingly clear that working long hours can affect wellbeing and damage health. A meta-review analysis of 25 studies in Europe, the USA and Australia, involving over half a million participants, found that those spending 55+ hours working per week were at greater risk of strokes than those working a standard week of 35–40 hours (Kivimäki, 2015). It is important for principals to manage their workload and wellbeing, deciding what *not* to do, to prioritize time and energies. In a study of Generation X school leaders (i.e., those under 40) it was noted that many principals were unintentionally discouraging the next generation to want to take on senior roles (Edge et al., 2021). Many people were being put off aspiring to headship by the responsibilities and risks they associated with the role and by the poor examples and role models they witnessed. Paradoxically perhaps, a large proportion of school leaders find the job enormously satisfying and would not want to do anything else (e.g., Earley and Weindling, 2004; Earley et al., 2016).

The loneliness of the principal’s role is considered in many studies and the emotional demands in the face of possible feelings of professional isolation are seen to be considerable and have not lessened over the years (Earley, 2013). A recent research study for the independent sector, which involved data collection from a variety of sources including a questionnaire survey, of the 155 respondents, a fifth said they did not manage professional isolation well, with experienced heads feeling it slightly more. One said “the isolation can be overwhelming and it sneaks up on you at funny times” (Earley et al., 2016).

This can be challenging in its impact on the health and wellbeing of leaders. The above survey also showed that heads’ wellbeing and work-life balance often needed consideration. For example, fewer than ten per cent stated that they were dealing with work-life balance “very well”, and fewer than 40 per cent were prepared to claim that they were coping even “quite well”. Nearly two-thirds

(64%) of respondents believed that they handled it “not well” or “badly”. Lifestyle advice was important for heads for as one experienced school leader noted “my mantra is ‘look after yourself, look after yourself’ – and what are you doing about it?” Annual health checks were considered valuable because: “heads are often bad at recognizing their own problems. They need to be more honest with themselves and actually require a bit of bullying to do something about their own wellbeing” (Earley et al., 2016).

Support for principals to deal with matters of professional isolation, workload and wellbeing may come from a variety of sources, both professional and personal. For example, research studies have pointed to the importance of fellow heads, senior colleagues, the chair of governors, local district officers, school advisers, networks (real and virtual), a coach or mentor, a spouse or partner. However, this support needs to be ongoing, flexible and responsive to changing needs over time (Bush, 2018; Earley et al., 2011).

Leaders need intellectual breadth and agility, self-awareness and self-confidence, good interpersonal skills, emotional management and high degrees of resilience if they are to deal successfully with complexity, resolve paradoxes and make informed decisions. They also need opportunities to think and reflect which is becoming increasingly difficult to find in the hurly-burly life of schools and the “busyness” of headship. The provision of support and opportunities to develop as highly effective and successful school principals is therefore crucial and given the earlier described context, more important than ever.

Surveying the leadership landscape, we find that the skills and capabilities required of school leaders have changed substantially, especially in England since the Education Reform Act of 1988 and the introduction of decentralization and school-based management (Earley and Greany, 2021). Simkins (2012) offers a detailed account of these changes and maps three distinct eras of school leadership training and development in England: the era of Administration; the era of Management; and the era of Leadership. To this we wish to argue the need for a fourth era of Leadership Development – or more accurately Leader Development – which in recognition of the current context in which principals work necessitates a greater focus on the personal needs of individual school leaders and the development of their personal leadership resources.

Developing leaders

Leader and leadership development are both critical at almost any level in an organization. We know that the most effective leadership development is that which provides a range of formal and informal learning and development activities and that the best programmes make good use of the workplace as a site for leadership learning. High levels of learning about educational leadership can occur as a result of attending an off-site training programme or because of the learning opportunities created within the workplace. Indeed the most effective leadership development is that which makes use of several methods in a complementary and reciprocal manner (Earley and Jones, 2010).

Preparation for leadership and on-going development programmes are common in both the private and public sectors. The trends are for organizations to have an approach to development which is wider than any programme and integrated in the work leaders do. Information that might previously have been delivered face-to-face is now often accessed online or covered in pre-course assignments. Face-to-face time is more oriented toward practice, discussion, reflection and feedback. Combinations of learning strategies are used, including lectures, case studies, experiential exercises, and simulations underpinned by feedback and coaching.

Approaches to leader and leadership development should be bespoke or personalized. The most successful training and development programmes are adapted to the needs of the individual and elements of customized programmes are now more commonly found (Pillans, 2015). It appears, as with teacher development more generally, it is not so much the case of “one size fits all” but rather that “one size fits no one” (Bubb and Earley, 2013). As such school leaders need to take greater responsibility for planning and implementing their own learning experiences to meet their personal and professional needs. In a similar vein, Lovett et al., (2015, p. 128) in their international review of school leadership development strategies, note “the limited role individuals seem to take in shaping their own professional learning, seemingly preferring to rely on others to determine what, why and how they should learn”. For them, leaders need to be able to reflect systematically and across time on their knowledge and understanding of leadership and that “knowledge of personal shortcomings and knowing what to do to overcome them is a particularly desirable self-related learning goal for leaders, because it helps them guard against arrogance, complacency, pretentiousness and narcissism” (ibid, p. 137).

In our view it is desirable to strive toward a healthy balance between what an individual “wants” and what they might “need”. Customized programmes are therefore essential and need a greater focus on the development of the individual leader, especially the development of the person – their personal effectiveness or personal efficacy – to enable them to be able to survive and thrive; and when necessary to revive. School leaders should be encouraged to take greater responsibility for their own personal and professional learning.

Opportunities to thrive, survive and revive

Principals and other school leaders’ development is most effective when time is built in for reflection but as noted above it is often hard to find such time given high workloads and “greedy” organizations. Structured opportunities to reflect with others (such as with a coach or in a tutorial or network) can lead to powerful learning. Reflection has long been identified as an important

leadership skill but it is in danger of getting lost due to work intensification. Adult learning theory or andragogy tells us that people need time and space to reflect on what they have learned and plan for how they will put such learning into action. But reflection does not come easily to busy people. The frenetic pace of life in schools makes it difficult to create space for leaders to reflect on what they have learned, and receive feedback and support, such as through coaching, all of which have been found to be critically important to sustaining adult learning (Pillans, 2015). Former headteacher and coach Viv Grant says:

What is needed is emotional support and a space for headteachers to reflect on how well they are doing the job and what they could do better. Social workers have supervision to help them process their toughest cases and corporate executives have space for lessons learned in between projects. School leaders need something similar.

(Grant, 2015 cited in Berkeley, 2021, p. 38).

Similarly, Nicholas and West-Burnham (2016) note that “in practical terms, the most powerful basis for (leadership) learning is supported reflection – support being provided through coaching and mentoring, the use of a reflective journal, structured reading to inform review and, perhaps most importantly, peer review and feedback on actual practice” (p. 22). It is increasingly recognized that learning is a key component of the job itself – not an adjunct or a bonus but a crucial element in the definition of the role – and therefore there is a need to schedule time and space for regular reflection along with networks (virtual and actual) to nourish, support and challenge. Layen (2015), using autobiography and life histories in her own exploratory development work with early childhood leaders, also notes the value of reflection for increasing self-awareness and self-concept. Furthermore, she sees insights so gained “may have potential to increase resilience, motivation and commitment and develop leadership maturity” (p. 286).

Experiences are important yet, “if people haven’t reflected on and learned from them, just having the experience in itself doesn’t necessarily mean people perform any better as a result” (Bowerman cited in Pillans, 2015, p. 31). Experience is not everything; people do not learn solely from experience but from reflecting on that experience – and that requires time. Leaders’ development is most effective when time is built in or created for reflection. Learning intensifies when we reflect on what we have experienced; and the more recent the experience we reflect on, the greater and more intense the learning. The key question, then, is how can opportunities for reflection and critical thinking be created for school leaders which will help them survive and thrive?

The role of coaching and mentoring in supporting reflection is discussed by Barnett and O’Mahony (2008) who argue that the coach’s ability to pose reflective questions to stimulate leaders’ thinking and action is perhaps the most important reflective tool. Coaches can stimulate thoughtful reflection through active listening and posing questions in non-threatening ways (Robertson, 2008) and there is no shortage of evidence that coaches and mentors influence the reflective abilities of the individual leaders they work with, helping them to examine various viewpoints, consider options and determine the best ways forward (Hobson, 2003). Coaching, especially executive coaching, can increase leaders’ self-awareness, improve their skills and decision-making, and help them become more reflective (O’Neal and Glasson, 2019; Jackson and Berkeley 2021a,b; Woods et al., 2020). Indeed, “in the quest for principled autonomy in leadership, nurturing the practice of critical reflexivity is essential” (Woods et al., 2020). Significantly, coaching can also help reduce professional isolation.

As well as coaching, opportunities for reflection can be created in other ways, e.g., forums, work discussion groups, action-learning sets, university programmes or courses, systematic study or short sabbaticals. They all have a role in encouraging reflection, research and critical thinking. In some parts of the corporate sector, leaders may have lots of peers around them, and bosses and team members who are increasingly used to giving support and feedback. These advantages are not routinely available to school principals, which may suggest that an emphasis on peer learning methods such as structured shadowing, coaching, mentoring and action learning are important, and more generally the creation of communities and networks where principals can learn and develop together. Some of this could be conducted virtually. Networks, both real and virtual, can be both supportive and reassuring to group members helping to combat the feelings of professional and personal isolation, while also encouraging reflection and ideas for strategic development.

Effective school leaders demonstrate certain qualities such as optimism, self-efficacy, resilience, proactivity and perseverance and they possess a range of “intelligences” – contextual, emotional, strategic, and of course cognitive intelligence. They need to draw upon all of these to be able to make the best possible decisions given the context and circumstances they face. Long working days are the norm but due to the nature of their job, heads cannot have an “off-day” as they constantly need to “perform”. As earlier noted, the importance of headship to effective school performance is now well established but ensuring that heads remain “at the top of their game” and do not “plateau out” (after 5–7 years) has long been recognized as a problem (Earley and Weindling, 2007). Headteachers need to be enabled to continue to thrive – or given opportunities to revive – if they are to continue to perform at the high levels demanded of them.

Many years ago, the James Report (DES, 1972) advocated a sabbatical period or study leave of one term for educational professionals after 7 years of service. This idea has been taken up in various forms in other parts of the world (Downing et al., 2004) and in some organizations employees (usually senior staff) with over 5 years’ service may be entitled to apply for a period of sabbatical leave. James’ idea was never taken up in England but in 2001 a sabbatical scheme for experienced teachers working in areas of high challenge was introduced in England (DfEE, 2001). This was part of a wider, ambitious government CPD policy, and although short lived, the NFER evaluation showed many benefits for both individuals and their schools (Downing et al., 2004) of this 6-week funded period of absence. For example, improvements in confidence, refreshment and self-esteem, along with raised skills and

knowledge were reported in 87% of sabbaticals, while in 83% of cases there were reports of the school developing as a professional learning community as a result of the sabbatical.

Crucially, a sabbatical, even if only for a relatively short-period, should help principals to survive (e.g., by knowing that there is a period of time during one's career to rest and recharge), to thrive (e.g., by undertaking study visits or a high quality course) and, if necessary, to revive (e.g., by being given time to rethink, to recharge, to be rejuvenated or refreshed). In the USA, sabbaticals or "time out" have traditionally been treated as "R and R" (rest and recuperation) rather than as providing development opportunities as has been the case in most other education systems where such schemes are found (Downing et al., 2004, p. 3). In some case the time away from school has been devoted to undertaking a course of study (study leave). Serious and systematic study, which is what undertaking a higher degree involves, provides opportunities for reflection and updating, research and networking. It helps to develop the "intelligences" earlier identified and an awareness of the qualities possessed by highly effective and successful principals. Academic studies are the place to ponder, study and grow, with experience-based debates scaffolded by theory and deeper conceptualization. For participants they provide "rich opportunities for the kind of learning that reflected personal goals in education" (Hargreaves and Preece, 2014, p. 144), including the spaces to interact with other leaders, to explore existing published research and to undertake research into areas they personally found important.

Some sets of leadership competences include "thinking" e.g., analytical, systems and conceptual thinking and the eagerness to learn – all are found in university accredited Masters and Doctoral programmes, along with the all-important critical approach to reading research and policy. Undertaking higher degrees and professional qualifications in leadership can be helpful and could be offered at various career stages when people are ready to gain maximum benefit from them. These and similar opportunities would enable school leaders to know themselves, "their ethics, values, strengths, weaknesses and motivations – and what it might take for them to make informed transitions from aspirant, to novice, to experienced leader. Knowing self is also fundamental to sustaining purpose, interest and commitment throughout a career (Lovett et al., 2015).

Secondments too, can provide opportunities for development, offer access to expert personnel and provide a safe way of exploring career options, although for some the return to school can prove difficult (Tuohy and Lodge, 2003).

In our view, following James (1972), the opportunity to take sabbaticals or study leave for principals, indeed all teachers, should be an entitlement. The idea needs consideration once again, despite existing budgetary constraints and teacher shortages. However, the manner in which a period of leave is used should not be prescribed but more the result of a discussion of needs with a coach, fellow head or line manager such as the governing body or board of trustees. Sabbaticals and study leave provide the opportunity for both leader development and leadership development to be much more personalized. They also provide opportunities to survive, thrive and revive as school leaders.

The school governing body or board of trustees can assist in providing services and offering support for school leaders. In English schools the governing body is specifically responsible for the wellbeing of the principal and there is greater recognition of the part "healthy" organizations can play in issues around staff wellbeing and welfare (Bubb and Earley, 2004; Bingham and Bubb, 2021). Steward (2014, p. 67) with specific reference to resilience, recommends that governors should be involved in supporting heads to undertake a regular risk-analysis with a resulting action plan. Regardless of its source, psychological support is needed since many school leaders work under considerable pressure, both physically and emotionally, feel exhausted, and often experience feelings of isolation and loneliness. Regular meetings of principals, both face-to-face and virtual, with a trusted group of others where problems can be shared and solutions found, along with sabbaticals or study leave for a period (a term, a month or even only a week) to undertake research, read or observe and learn from an outstanding leader, are examples of valuable opportunities for both surviving, thriving and, where needed, reviving.

Another benefit of sabbaticals, study leave and secondments is that other members of staff will have to "act-up" temporarily. Highly effective leaders are recognized as developing other leaders and participating in such activities will help develop leadership capacity and capability in others, as well as assisting with succession planning. James' (DES, 1972) recommendation of a term's secondment every 7 years is an important means by which exhaustion and burn out can be prevented and opportunities given for personal and professional refreshment and rejuvenation.

Conclusion

The OECD's leadership reports (Pont et al., 2008; OECD, 2009; Schleicher, 2012) identified four policy levers which, taken together, can improve school leadership practice, namely:

1. (Re)defining school leadership responsibilities
2. Distributing school leadership
3. Making school leadership an attractive profession
4. Developing skills for effective school leadership

To the last OECD policy lever we would wish to add the need for a greater focus on the individual leader and their personal and professional needs, to personalize development and to offer the support necessary to survive and thrive in what is generally perceived to be an ever-demanding role in a challenging and constantly changing environment. Following Simkins' (2012) classification, we wish therefore to argue for a fourth era of "leader development" where there is a greater focus on personal development and personal leadership resources.

Learning to be a leader at any level in an organization is not a one-time or one-off event but a continuing or career-long process. Leaders' skills can be developed when their role and responsibilities are clearly defined and specific training in those skills is made available to them (Schleicher, 2012). An emphasis on peer learning methods such as structured shadowing, coaching, mentoring and action learning are going to be important in any leadership development programme and more generally the creation of communities and networks of leaders, both virtual and real, who can learn and develop together (Darling Hammond et al., 2009; Fluckiger et al., 2014).

In this article we have argued for the need to ensure we do not lose sight of the individual and their personal development, or what Water's (1998a,b) refers to as "pro-personal" development. A greater emphasis needs to be given to Leithwood's (2012) personal leadership resources. The importance of developing self-awareness, emotions management, being reflective and resilient while managing workload and wellbeing should not be underplayed. Individual or personal effectiveness or efficacy is key for continuing success as a leader yet is not given the prominence it deserves. We have suggested there is a need for a combination of customized or bespoke school-based and externally-provided developmental opportunities and experience to be provided in a range of settings. These should be based on careful analysis of an individual's needs (Crawford and Earley, 2011) and include strategies to enhance personal efficacy.

There needs to be a growing recognition that schools should be seen as "healthy organizations" where concern is shown not only for professional development but also for individuals' personal development, their workload, welfare and wellbeing. Unsurprisingly, when educational leaders are overworked, emotionally strained and forgetful about their own wellbeing, their performance is affected negatively. Mahfouz (2020) when discussing stress management argues that if we wish to retain school leaders and help them lead their schools effectively then there is an urgent need to focus on social emotional skills based or mindfulness-based programmes that include self-awareness and self-management. Similarly, O'Neal and Glasson (2019) in an evaluation of an innovative, multi-dimensional development programme for experienced heads in Australia, point to the need to focus on health and wellbeing (underpinned by an executive health assessment) as this was found by far to be the most successful aspect of the program.

This article has argued that greater consideration be given to the role of sabbaticals and study leave to help principals – and other educational professionals – to survive and thrive. Coaching too is an important part of the personalized route and where it exists it has been highly valued, helping to develop leaders' thinking and reflection (e.g., Blackman, 2010; Crawford and Earley, 2011; O'Neal and Glasson, 2019; Jackson and Berkeley 2021a,b) and resilience (e.g., Sardar and Galdames, 2017; Steward, 2014). For Jackson and Berkeley (2021b) "coaching should be seen as a *basic duty of care* rather than an individual indulgence—especially in the context of national concerns regarding headteacher wellbeing, recruitment and retention" (p. 98 emphasis in original). However, as they further note:

Rather than viewing regular professional development, such as coaching for themselves, as a fundamental duty of care owed to them—as they might with any other member of staff—they are often inclined to think of it as a *luxury* or even an *indulgence* (p. 114).

Capacities necessary for on-going effective leadership include the capacity to collaborate with others, the capacity for resilience, and the capacity to survive and thrive in complex contexts. As Kellerman (2012) has remarked "leading has become a high wire act that only the most skilled are able to perform successfully over a protracted period of time" (2012, p. 263). We must ask whether it is reasonable to expect principals to continue to undertake such a high powered, challenging and demanding role for a number of years and continue to do it well without the provision of opportunities to survive and thrive, and where necessary, revive. If the role of the principal is to be seen as attractive *and* manageable, then consideration must be given to providing more assistance, greater support and development – especially personal (leader) development – with the recognition of the need for opportunities for professional refreshment and rejuvenation. In this way the chances of schools being well-led and managed and high achieving will be considerably improved.

Introduction

Education systems around the world are developing policy frameworks to support greater equity for all within a context of global uncertainty and challenge, increasing school autonomy, accountability, and competition (Ainscow et al., 2018; Brown, 2004; Riddle and Apple, 2019). A focus on equity ensures that people are treated fairly according to need rather than everyone treated equally in the same way. Equal treatment perpetuates existing inequalities (Ryan and Rottmann, 2007). Leadership for equity is also aligned with social justice leadership (Blackmore, 2002) that aims to advance equity and address marginalization in education. Effective school leadership is instrumental in education reform and change in an education system and at school level (Fullan, 2005).

School leaders working to enact socially just change need support to “confront socially difficult topics with respect, dialog, and a continuous expansion of awareness, acknowledgment, and action” (Brown, 2004: 80) and this requires leaders to understand their own beliefs and values that inform their ethical and moral behavior. This article will firstly consider a range of international trends that influence the challenges and priorities for school leaders. Secondly, theoretical approaches are considered that guide a way forward for school leaders. Thirdly, the article addresses the challenges and ethical dilemmas that school leaders face when mobilizing equity in schools. Fourthly, a range of leadership taxonomies and frameworks are described that could inform professional learning for aspiring and current school leaders. Finally, two Australian studies describe ways that school leaders have enacted change for equity within policy contexts that emphasize competition and top-down accountability.

International trends

Addressing equity in education is a challenge when “exclusion resides deep in the bones of education” (Slee, 2018: 11) where there is a long history of connection between schooling and divisions in social class due to race, ethnicity, gender, geography, sexuality, ability and disability, and religion. In current times, there is also a focus on standardization, testing and increased accountability, and the quality of school leadership and teaching. This trend has been described as the Global Education Reform Movement (GERM) (Sahlberg, 2012). These international trends have led to increased rather than decreased disparities in education quality and opportunity between advantaged and marginalized groups because it may be perceived that supporting students who need additional help, such as students with disability, poses a threat to success in the competitive school market

(Ainscow et al., 2012). Patterns of disadvantage may be so deeply ingrained in education and may not be recognized, particularly by school leaders and teachers. There is a need for school leaders to address unexamined everyday practices in schools including patterns of interaction between students, staff, and parents. As Slee (2018: 16) suggests:

Schools are forged within the furnace of competitive individualism, and students are reduced to the bearers of results. They become individually measurable units that when aggregated reveal the performance of a teacher, a school, a school district, state jurisdiction or nation-state. As individual units, students manifest risk or opportunity.

Despite the impact of economic, political, and cultural factors on inequality in education and society, there has been a steady movement toward a more inclusive approach to schooling that promotes equity, influenced by a human rights perspective.

Governments often call for school leaders to address new policy initiatives such as equity without consideration of the complexity required for long-term sustained change (Niesche and Gowlett, 2019). There may also be a lack of understanding about how system and school organizations perpetuate educational inequity despite school leaders trying to lead organizational change in their schools (Rottmann, 2007). Change in education requires challenging dominant norms in ideas and values that impact on how people are viewed and included or excluded in schools and school leaders may not have the knowledge and skills to help people in their schools to critically reflect and consider alternative approaches to schooling. Preparing school leaders to drive change for equity and social justice requires allocating time for leaders to learn about how schooling perpetuates inequality so that they can consider different points of view and develop a values base that aligns action with vision. The frameworks and taxonomies (see “**Leadership frameworks and taxonomies**” section) will be useful for school leaders to support self-reflection and guide understanding of knowledge, skills, and mindsets that are required to lead schools in increasingly complex times.

An inclusive approach to education

A focus on inclusion in education is based on a commitment to key values such as equity, justice, moral and ethical integrity, an appreciation of diversity, and the importance of contributing to and benefiting from a deeper understanding of other cultures. Inclusive education is an approach where all people are valued and treated with respect (Booth and Ainscow, 2011), and is endorsed by the widely ratified United Nations (UN) Convention on the Rights of Persons with Disabilities (CRPD) (UN, 2006) and Sustainable Development Goal Four, which is to “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all” (UN, 2015). These international conventions, combined with anti-discrimination legislation, have influenced national policy around the world to support inclusion for all students in schools. We now have a conclusive body of evidence that shows that an inclusive approach to education leads to positive academic and social emotional outcomes for all students (Cologon, 2019; Hehir et al., 2016; Szumski et al., 2017).

Achieving an inclusive approach to education is challenging because it requires school leaders and teachers to challenge their understanding of difference that draws on a social-cultural perspective of diversity in society (Carrington and Saggars, 2021). The values and beliefs embedded in these perspectives create a new set of possibilities, expectations, and commitments in education (Skrtic, 1991) that could be achieved in a “moving school” which is continually seeking to develop and refine its responses to the challenges it meets (Rosenholtz, 1989). Moving a school forward to support equity for all students requires a more reflective and critical approach to school leadership at both the systems and school levels, as well as collaborative teamwork (AuCoin et al., 2020).

A way forward: leadership for equity

Effective school leadership is an important factor in bringing about any significant change in the education system (Day et al., 2009) and a critical approach to school leadership is consistent with progressing the ideals of equity and inclusion (Ryan, 2007). School leaders who take a critical approach drive change in the education system, the school, and for individuals with a focus on addressing inequity for the less fortunate and marginalized students. These leaders recognize that they have a leadership role to raise awareness of oppression and injustice so they can act to change them by working collaboratively with school stakeholders (Ryan, 2007).

A critical approach to school leadership links leadership and change (Rottmann, 2007) and acknowledges the importance of school context (Niesche and Gowlett, 2019). School leaders would consider opportunities for change in all areas of school culture, policy, and practice and would be “open to challenging systemic oppression” (Rottmann, 2007: 77). There is a need for school leaders to make choices between competing forces between the political and bureaucratic requirements and the needs of their teaching staff and students (Mulford et al., 2009).

Shields (2014) describes transformative leadership as a critical approach that is linked to promoting equity and inclusion with a focus on a sense of values and beliefs that inform how leaders think and lead. School leaders have a transformational role that can impact individuals and the collective of staff, students, and parents in their school community by developing relationships that are equitable, caring, and open. A transformative leadership approach requires collaboration and inclusive governing structures to address inequity and fosters an inclusive school culture (Cooper, 2009). Leaders who are committed to enact equity need to be activist oriented and morally transformative (Dantley and Tillman, 2006).

This type of approach is required for school leaders wanting to establish an inclusive school culture (Carrington, 1999).

It is acknowledged that taking a critical and transformative approach to leadership has a risk of focusing too much on critique without considering practical ways forward (Niesche and Gowlett, 2019). These authors suggest that “education leaders want straightforward answers and solutions to help make their jobs easier and their leadership more effective and that socially critical perspectives hinder this work” (Niesche and Gowlett, 2019: 18). Leading socially just change requires school leaders to “disrupt rather than reinforce the current social order” (Rottmann, 2007: 60) and this takes time at an individual, collective, and theory level. With these thoughts in mind, the educational change required for our schools to be equitable and inclusive for all students will need to be slow and incremental and require critical dialog and planning over time with people at school and system levels of education (Rottmann, 2007). This is because there is a need for multiple levels of change. While it is necessary to acknowledge this complexity, school leaders have an important role in their own school communities to recognize inequities and injustices and interrupt and challenge the status quo. It is clear that long-term change requires school leaders and staff to work together over a sustained period of time.

Leadership for equity

School leaders who wish to promote an inclusive, equitable, and transformative agenda for their schools are often confronted with questions about how to ensure that their leadership is ethical (Shields, 2014). “Ethical leadership is the attempt to act from the principles, beliefs, assumptions, and values in the leader’s espoused system of ethics” (Starratt, 2004: 5). A school leader wanting to progress equity needs to have the courage to examine, challenge, and, as necessary, correct situations and practices that promote inequity. This will involve drawing on ethical principles that guide decision making to drive change, action, and advocacy to affect the change. An ethical school leader adopts an analytical stance when examining their actions and resolving problems (Yasir and Mohamad, 2016).

Recently there has been a stronger emphasis on understanding how ethics and morals guide school leaders to recognize that leadership is values-based (Cranston et al., 2006; Fullan, 2003; Sergiovanni, 1992; Starratt, 2012). “Values are fundamental guides and prompts to action. They spur us forward, give us a sense of direction and define a destination” (Booth, 2011: 33). School leaders can guide their school community to develop a shared set of inclusive values that supports a clear vision for the school (Cologon, 2019). The leader’s ethical decision making and actions need to be consistent with that vision and shared values. It is acknowledged that school leaders operate “within established cultures and existing contexts that influence the effect of actions, and—consciously or unconsciously—change the culture of their schools through their actions” (Swaffield and Major, 2019).

Challenges in leading for equity

School leaders have challenges and face complex ethical dilemmas when making decisions that will impact on people’s lives and this is what they say often keeps them awake at night (Cranston et al., 2006). They are often grappling with situations that concern individuals, collectives in the organization, systemic policy, and the social-cultural and political context. With a focus on progressing an inclusive approach to schooling that promotes equity, there is a need for a school leader to be brave in leading dialog where there will be different views and values that need to be heard. Compassion and respect for all, good communication, and a calm and steady approach will be required when discussing challenging topics such as: Who gets what?; How to distribute resources between individuals and groups?; Who is treated in what ways? (are learners valued equally?); Is there a hierarchy of valuing some characteristics and cultures more than others?; Who can do what? Drawing on the work of Kidder (1995), Duignan (2012) described the following categories of tensions that impact on making decisions:

- **Common good and individual good.** This challenge is about how a decision will promote the good of a group such as a group of students or parents, or the rights of an individual such as a teacher or a student.
- **Care and rules.** Decisions are influenced by the compassion of the school leader for the individual circumstances and consideration of how that might override policy or rules.
- **Long-term and short-term considerations.** Any decision made by a school leader will have long-term or short-term consequences. This is particularly relevant as leading change to support equity and inclusion requires a long-term plan to allow for dialog, reflection, and planning with a school community.
- **Loyalty and honesty.** School leaders are torn between being committed to an organization and colleagues, for example, and this may influence if they can speak truthfully about a situation.
- **Service and economic rationalism.** Promoting equity for all in schools is likely to clash with the imperatives of economic rationalism associated with increasing accountability and improving school performance.
- **Status quo and development.** School leaders progressing equity in schools often need to challenge the status quo and enact, develop, and embrace change.

School leaders usually have many opportunities to learn administration and managerial skills but often have not had the opportunity to learn and embrace the ethical dimensions of leadership that impact on leading schools for equity (Starratt, 2004). The impact of critical theory has led to approaches to school leadership that are critical and transformative and this requires school leaders to have a greater self-awareness and ideological clarity (Dantley and Tillman, 2006). If we expect school leaders to challenge

others' thinking and practice then we need to support school leaders to have a better understanding of leadership roles and attributes that may influence their work. This is particularly the case for school leaders working to support equity and social justice as they face many pressures and dilemmas as discussed previously. School leaders need to not only have the knowledge and expertise to drive students' performance higher but also have the leadership attributes to support equitable decision making to equalize outcomes for students (Gross et al., 2003). A range of leadership frameworks and taxonomies can support professional learning for school leaders who want to work in critical and transformative ways.

Leadership frameworks and taxonomies

A range of leadership taxonomies and frameworks have been developed to support a better understanding of the roles and attributes of school leaders (Yukl, 2012). Leadership attributes could include the values that influence reasoning that might influence how a school leader enacts socially just change. A school leader will have values that influence approaches to decisions about staff, students, resources, assessment, curriculum, and pedagogy. Attributes of school leadership include whether or not leaders adopt a collaborative approach and the extent to which leaders develop trust among staff (Karami-Akkary et al., 2019). Taxonomies and frameworks of behaviors and attributes can support understanding about how they interact in complementary ways in context and could inform professional learning programs for school leaders (Yukl, 2012).

Following is an overview and comparison of the taxonomies and frameworks that can be used to support the work of school leaders working for socially just change.

Yukl (2012)

Yukl (2012) reviewed the literature and developed a four-level hierarchical behavior taxonomy with 15 specific behaviors for effective school leadership. The particular focus of Yukl's work was on school leadership to improve performance. The four elements of this taxonomy (Yukl, 2012: 68) are: (1) task-oriented ("to accomplish work in an efficient and reliable way"); (2) relations-oriented ("to increase the quality of human resources and relations"); (3) change-oriented ("to increase innovation, collective learning, and adaptation to the external environment"); and (4) external ("to acquire necessary information and resources, and to promote and defend the interests of the team or organization"). The 15 specific behaviors associated with each level are listed in Table 1.

Yukl (2012) concluded that more research is needed to explore how leadership behaviors interact in different situations or contexts. This was because he noted that aspects of the situation or context, such as the socio-economic and cultural backgrounds of families and incidence of students with disability or learning difficulties in the school, determine which leadership behaviors are relevant in the context. He emphasized that it is the flexibility of behaviors that is important for effective school leadership (Yukl and Mahsud, 2010) and this will be particularly relevant for school leaders working to achieve equity. Yukl actually acknowledged that future research could establish a fifth focus on ethical and socially responsible behaviors that could include a values approach to behavior (2012). This would be a welcome addition to this taxonomy and support professional learning for leadership for equity. This might involve behaviors like communicating ethical standards, encouraging ethical conduct based on a set of inclusive values, modeling ethical behavior, and opposing non-ethical conduct. The idea about another area of consideration that reflects ethics and values is also supported by Brown and Treviño (2006) review of ethical leadership and theoretical influences. It is clear that research on understanding leadership ethical behaviors and the effects of ethical leadership is limited.

Table 1 Comparison of Hitt and Tucker (2016) and Yukl (2012) taxonomies.

Hitt and Tucker (2016) taxonomy	Yukl (2012) taxonomy	
Establishing and conveying vision	Relations-oriented	Supporting
Facilitating a high-quality learning experience for students		Developing
Building professional capacity	Change-oriented	Recognizing
		Empowering
		Advocating change
		Envisioning change
Creating a supportive organization for learning	Task-oriented	Encouraging innovation
		Facilitating collective learning
		Clarifying
		Planning
Connecting with external partners	External	Monitoring operations
		Problem solving
		Networking
		External monitoring
		Representing

Hitt and Tucker (2016)

Hitt and Tucker (2016) synthesized the research about leadership frameworks from 100 studies published between 2000 and 2014 to develop a unified framework that organizes leadership practice and behavior into five overarching domains: (1) establishing and conveying vision; (2) facilitating a high-quality learning experience for students; (3) building professional capacity; (4) creating a supportive organization for learning; and (5) connecting with external partners. Each of these domains will now be described.

Establishing and conveying vision

This domain includes creating and articulating the vision for the school and setting goals and performance standards that are linked to the vision. The key point is that school leaders need to work with staff over time in collaboratively developing the vision to ensure that their values are reflected in the everyday work. Hitt and Tucker (2016) emphasize that it is the methods by which the direction is decided and the associated activities that are important.

Facilitating a high-quality learning experience for students

Hitt and Tucker (2016) acknowledge the need to personalize the learning environment to meet the diverse needs of students. This is supported by DeMatthews et al. (2020) who suggest that in the context of inclusive education, school principals need to lead teachers in discussing and planning learning experiences for students and challenge the status quo and deficit-based beliefs associated with teaching students with disability.

Building professional capacity

This area of the framework focuses on providing opportunities for school staff to learn together and create communities of practice. It is generally understood that education staff need to be confident, have a positive attitude, and have the knowledge and skills to teach all students in an inclusive approach (Cologon, 2019) and it is clear that professional capacity building and support can influence professional growth for teachers who are trying to be inclusive (Saggers et al., 2019). School principals provide leadership for the development of professional learning communities to support teacher learning (Hoppey and McLeskey, 2013).

Creating a supportive organization for learning

This domain is focused on the organization and considers how decisions are made about access and use of resources in the school. There is an expectation of collaboration and shared leadership that values diversity, supports high expectations, and builds a strong school culture. Behaviors that could be considered in this domain reflect relationships and how people in the school community work together.

Connecting with external partners

This domain includes three interrelated dimensions that are important for progressing inclusion: building positive relationships with families and community; engaging families and community in collaborative processes to support student learning; and ensuring that schools are the base of a community and that leaders and teachers can connect families with support when required.

DeMatthews et al. (2020) aligned the Hitt and Tucker framework with the work of school leaders of inclusive schools in the US and suggest this framework represents the field's most current understanding of effective leadership practices for inclusive education despite a lack of targeted focus on inclusion. The DeMatthews review (2020) uses the five domains from Hitt and Tucker (2016) to organize and present findings about inclusive school leadership literature in the US. The authors suggest that the five domains, which are interrelated, are consistent with the leadership practices used by principals in inclusive schools as they influence teacher capacity, school culture, and organizational conditions.

Neither Yukl (2012) nor Hitt and Tucker (2016) leadership taxonomies include leadership relation-oriented behaviors such as collaboration, support, and encouragement based on values and ethics (Daniëls et al., 2020).

Starratt (2014)

Starratt (2014) ethics of leadership—which incorporates care, justice, critique, and community—is a useful framework to support leaders to progress inclusive education (Harris et al., 2020). School leaders can pursue an ethic of care by valuing diversity, confronting stereotypes, and having high expectations for every child. The ethic of justice relates to authority and management within an education system, particularly in a school that considers equity and fairness. The ethic of critique is where school leaders look at their school in terms of structural justice and injustice to promote common good, such as ensuring high expectations of every member of the school community. Using the ethic of critique is essential to ensure an education system or school supports an ethical and inclusive culture.

Duignan (2012)

Duignan (2012) framework for analyzing ethical tensions supports school leaders to make choices in situations where there may be opposing values and ethical positions. The framework encourages a both/and mindset rather than an either/or mindset. Taking a both/and mindset encourages leaders to “look for the positives and the complementaries in these tensions and try to choose options that reflect a dynamic balance between considerations for both rules and caring” (Duignan, 2012: 82) by opening up situations to dialog through collaborative analysis, and multiple and mutually dependent relationships. This results in informed decisions and choices that consider the complexity of the dilemma. This framework is appropriate for leaders taking a critical and ethical stand because they are encouraged to look for multiple perspectives, perhaps challenge the status quo, and contest historical ways of thinking and practice. Duignan explains that this type of approach supports systems thinking (Senge, 1992) which helps the school leader to see the whole situation and the interrelationships and patterns of change.

Brown (2004)

Brown (2004) developed a framework to support a critical transformative approach for school leadership for social justice and equity. “A Pedagogy of Transformative Leaders” is a framework for professional learning for school leaders that highlights the context, theoretical understandings, and pedagogical strategies to support knowledge, skills, and desire to support equity (Brown, 2004: 79). Key theories such as critical theory (Giroux, 1983) and transformative learning (Mezirow, 1991) underlie the importance of facilitating critical reflection through dialog with consideration of local context required for a school leader to enact socially just change. Critical social theory drawing on the work of Freire (1994) supports a commitment to constant reflection and social change for a more equitable world. In the framework, these vertical theoretical threads are overlaid with horizontal threads focused on critical, transformative pedagogy to support learning. A transformative learning approach (Mezirow, 1991) drives critical examination of world views, values, and beliefs that are influenced by social and cultural contexts that drive goals and actions for enacting change.

Theoharis (2007)

Drawing on a qualitative study with seven school principals in the Midwestern states of America, Theoharis (2007) developed a three-pronged framework of resistance: (1) the resistance principals enact against historic marginalization of particular students; (2) the resistance principals face as a result of their social justice agenda; and (3) the resistance principals develop to sustain their social justice agenda in the face of resistance (Theoharis, 2007: 248). This framework can inform professional learning for aspiring school leaders. Theoharis (2007) suggests that the strategies described by the principals in his study and organized in his framework can be used to prepare leaders “to both enact and develop resistance in the face of significant barriers” (Theoharis, 2007: 249). He describes how the combination of knowledge and skills combined with the ability to facilitate critical reflection can guide future planning. He also provides some guidance for future leaders to develop their own resistance and resilience as they lead the change. These strategies acknowledge the ethical dilemmas faced by school leaders and support the need for a professional network to reduce the stress and burnout involved in this important leadership work.

School leaders who are driving socially just change will challenge and re-invent existing structures, practices, and relationships; however, there are few studies that report on ways that school leaders enact change for social justice and equity (Theoharis, 2007). The following section of this article reports on two studies that highlight how school leaders in Australia have enacted change.

School leaders enacting change: Australian studies**Study one: promoting equity in schools**

A team of academic researchers (Harris et al., 2018) worked with a network of six schools over three years to explore how school leaders worked with staff and students to develop more inclusive and equitable education. The school leaders were challenged in many ways to focus on equity and inclusion in a context of high-stakes testing and school choice which often focused on increased segregation and particular disadvantage for young people from minority backgrounds. This study built on international research that has established that inclusive schools are most successful in improving all students’ learning by establishing an inclusive school culture where staff, students, and parents’ voices are valued (Harris et al., 2018). The outcomes of this Australian study highlight how school leaders work in ethical ways, drawing on Starratt’s Framework of Ethical Leadership (2014). The resulting book—“Promoting Equity in Schools” (Harris et al., 2018)—provides detailed accounts of how school leadership facilitates the ethical, collaborative, and critical work with senior school leaders, teachers, and students.

One school project considered how using school performance data from the national testing system stimulated new ways of thinking to support greater attention to equitable student support. Critical discussions led by school leaders focused on questions such as: Why are things as they are? What type of support needs to be actioned to support more equitable outcomes for all students? School leaders in these schools interrogated the data with a collaborative team of school stakeholders that informed new ways of thinking about promoting change in relation to equity. Other inquiries in schools focused on teaching and learning projects within and across classrooms. Some school projects highlighted how students played active roles in collaborative inquiries and offered new

perspectives on teaching and learning. School leaders, who valued student perspectives, were able to interrupt existing assumptions that were not aligned with an equitable approach.

Further examples of a whole school approach to supporting equity and collaborations with other schools and the wider community also highlighted how collaborative inquiries can support school leaders to facilitate new ways of thinking and practice to support equity in schools (Harris et al., 2018). A critical and transformative approach is evident in the accounts of school leaders who developed an understanding of ethical challenges by gathering evidence to inform their decision-making using cycles of inquiry. This critical and transformative approach could facilitate school leaders to become more aware of how their leadership practice and behavior reflect the five domains in the Hitt and Tucker (2016) leadership framework and this could be important future research.

Study two: using the index for inclusion to promote equity

This study reports on the phases and outcomes of a whole school approach that utilized the Index for Inclusion (Booth and Ainscow, 2011) to promote a sense of belonging and connectedness for all students (Carrington et al., 2021). The Index for Inclusion (Booth and Ainscow, 2011) is informed by a values framework that guides “how we should live together” (Booth, 2011: 38) and supports school leaders, teachers, students, and families to reflect and have dialogs about how they can make their school a better place for all with a focus on inclusion, belonging, and connectedness. School leaders who want to promote equity and socially just change in their schools will find the Index for Inclusion provides a set of tools and resources to support a critical and transformative approach (Carrington et al., 2012) that aligns with Yukl’s fifth taxonomy missing element on ethical and socially responsible behaviors (2012). The process of using the Index for Inclusion in transformative leadership work enables school leaders to develop a values framework to support continuous school renewal that can lead to deeper and committed change and reform. The processes of engagement with the Index for Inclusion supports the development of a collective vision and action for change such as explained in the Hitt and Tucker framework (2016). Through questioning current values and practice or “the way we do things around here”, school leaders can guide teachers, parents, and students to create a more equitable and inclusive school.

The recent study reporting a whole-school approach in an Australian case study school (Carrington et al., 2021) highlights how school leadership can support a process of critical self-review and development by inviting stakeholders to have dialog and explore “other’s opinions and assumptions on the basis of equality, honesty and trust” (Booth and Ainscow, 2011: 19). The approach described in this case study explains how a school committee led cycles of planning, data collection, collaborative analysis and setting new school priorities about how students could be better supported in equitable ways. The Index provides a framework for sharing of perspectives and issues of concern between parent/community members, staff, school leaders, and students in a way that can facilitate deep learning and understanding about the values of inclusive education. In order to support use of the Index, a committee made up of school community stakeholders was established in the school to oversee the five phases of the Index: (i) getting started with the Index, (ii) finding out about the school, (iii) producing an inclusive school development plan, (iv) implementing priorities, and (v) reviewing actions and progress. This study highlights how leadership of a shared commitment to values that guides a process of critical review and development, using the Index for Inclusion, can support the development of greater awareness of equity and inclusive education.

Conclusion

If education systems expect school leaders to implement policy and create school cultures to support greater equity, then it is appropriate to consider current trends in education and the knowledge and skills needed to mobilize change in schools. Education reforms to improve equity in schools in the US have been unsuccessful at changing embedded practices that result in inequitable education. Reasons for this lack of success can be attributed to little understanding of the knowledge, skills, and attributes required for school leaders who are working in complex contexts with people who have multiple values and perspectives (Kozleski et al., 2020). Change for equity in schools takes time due to the critical reflection, dialog, and commitment to shared values of equity and inclusion required to support long-term actions for the greater good in schools. A critical and transformative approach to school leadership, as described in the Australian studies, will support school leaders to build relationships and work in partnership with students, parents, and educators in schools to initiate transformative reform and support equity in education. Future research should include a greater focus on the leadership taxonomies and frameworks described in this article. This future research could support a better understanding of how school leaders enact socially just change and support professional learning for school leaders.

Apple (2013) provides us with hope when he suggests that education can change society to supporting equity. We know that schools are communities made up of school leaders, teachers, students, and families and they all have obligations and roles to play in the school to ensure they are respected, included, and belong. However, it is the school leaders that lead the visioning and action to reframe school culture, policy, and practice. Cooper (2009) acknowledged that critical and transformative leadership to support equity is challenging but suggests that research indicates that it can be achieved with a collaborative approach with education stakeholders. The two Australian studies illustrate how school leaders can work in critical and transformative ways,

engaging in cycles of inquiry and collaboration with staff, students, and parents. The theoretical approaches and the taxonomies and frameworks described in this article can guide and support future and current school leaders to learn about leadership behaviors, attributes and values to support an appreciation of diversity and greater equity in schools.

Introduction

According to John’s gospel (14:2), “in my father’s house are many mansions,” rather resonant with contemporary accounts of the multifarious sub-fields of leadership, its conceptions and practices. Nonetheless, in recent decades there has been a sustained effort, through various aspects of new public management (NPM), to reduce what counts in leading schools to being accountable for learning outcomes, frequently narrowly conceived. Increasing external policy prescriptions have serious consequences for the formation of school leaders, and, importantly also, for learners. Our focus in this chapter is on school leaders’ formation, and how this process, shaped significantly by external policy environments, has enormous consequences for leaders, who they have been and continue to become, while emphasizing also that, as research indicates, school leaders’ impact on the quality of teaching and learning, though indirect, is nonetheless, considerable (Day et al., 2016; Leithwood et al., 2008, 2020; Pont et al., 2008; Robinson et al., 2008). Thus, by paying focused attention to leader formation, particularly the dynamic interplay between the personal and professional, space to grow and flourish is extended, with positive consequences for all. In the Irish context, as schools reopened after Summer vacation, there have been calls for schools to cater for “messers, dreamers and misfits” (O’Toole, 2021, pp. 9–10) in addition to the mainstream, a provision that allegedly exists under the mantle of “Inclusion.” The author in question readily recognizes the necessity for rigor and standards but appeals also for space to accommodate and educate “the misfits and the dreamers and the people who don’t know what they’re doing until they stumble into it” (O’Toole, 2021). However, the “formation” of students cannot be divorced from the formation of teachers, principals, curricula and pedagogies (Leithwood et al., 2004). Thus, schools are the smithies wherein the formation of school leaders, teachers, and students alike, are crafted on the anvil where the personal and professional collide, subjected to the heat of the policy moment, immediate context, teachers and principal’s values and priorities, as well as the vicissitudes of our time.

What is formation? According to Sutphen and de Lange (2015, p. 412) “formation [is] ... the process of change that students undergo ... as well as ... faculty members ... as they teach” and as students learn. From a student perspective, formation is a broad church that encompasses: “the changes that students undergo in their outlook, values, behaviors, ideals, goals and interpretations of experiences in the course of being a ... student” (Sutphen and de Lange, 2015), while the term may be extended to embrace the life course, including the personal and professional lives of teachers and school leaders. Such a formative education extends well beyond performance as measured on a narrow range of learning outcomes, and embraces a moral dimension. It is legitimate to ask when focusing on contemporary education: to what extent do current external policy environments, curricula, pedagogies, and leadership practices, promote or constrain student, teacher and school leader formation as envisaged here?

In the increasingly fast paced globalized world, there are constant appeals for “leadership,” needed now more than ever, these clarion calls suggest, while others lament both the lack and apparent loss of leadership (Iacocca, 2008). However, such calls, no matter how well founded, are rendered somewhat impotent in a post-truth society, where: facts, alternative facts, emotion, reason, fueled by a pervasive social media and a news cycle that never sleeps become a miasma of confusion rather than clarity; an erosion of shared senses of “common good” where, it is argued: “The climate crisis, the global pandemic and its inevitable economic aftermath have revealed the extent to which our existing social contract is no longer working” (Shafik, 2021, p. xiv). Despite the “achievement gap” (Wagner, 2008), and recognition of its existence and increase (Piketty, 2014), there is general support for “the value of education” since it “reflects both the benefits to the individual and the gains to society as a whole of having an educated population”

(Shafik, 2021, p. 49). What is the nature of the social contract that cements the relationships between school leaders, teachers, their learners, and their communities? Arguably, all four volumes of this Encyclopedia are devoted in one way or another to responding to this enormous challenge. More modestly then, it is appropriate to ask: what aspect of this monumental task is to be addressed here?

The next section takes a narrative approach to extant literature, exploring the significance of values in leadership formation, with particular emphasis on the interplay between the personal and the professional. As a “tool” for unpacking this, the subsequent section presents a synthesis of Foucault’s notion of ethics, subsequently employed in the empirical section to explain and elaborate upon examples of leadership formation from the perspective of the lived realities of school leaders. The concluding discussion recapitulates the importance of the moral dimension of leadership, the values that shape it, while acknowledging the necessity for greater attention to this aspect of leader formation, and, when necessary, recognize the place of resistance in leadership when values conflicts arise.

Leader formation: finding the “sweet spot” between fragmentation and coherence?

In our pursuit of an elusive “spot” in an increasingly fragmented field of leadership literature, and the more mundane recognition that school principals and leaders have a responsibility to make decisions, and to act, often in challenging circumstances, we readily recognize that the contours of our journey are not terra incognita, but rather have been mapped in various ways by a variety of scholars. For example, the following clearly asserts the significance of values in the lives and work of school leaders:

In Day et al.’s (2001) study, they stress the importance of school leaders’ personal values informing their professional values and practices. Woods’ (2000) research reveals the extent to which school leaders’ values and reflexivity influence their actions and perceptions.

Campbell et al. (2003, p. 205).

What this evidence suggests is that recognizing the importance of values is significant, though not an end in itself. Rather, from a leadership formation perspective, values combined with reflexivity, have potential to contribute to the ongoing formation of leaders and teachers, working toward and contributing to a leadership praxis, that:

...implies a combination of reflection and action; not one or the other, but both. It seeks to hold in productive tension thought and action through critical reflection. ... it includes a moral dimension, informed by and imbued with one’s values, and beliefs that constitute a world-view.

Solbrekke and Sugrue (2020, p. 8).

Arising from this particular confluence of considerations there is recognition that values permeate principal’s “perception of their leadership role, their relationships with students, staff and the local community” (Campbell et al., 2003, p. 217). Consequently, there is sustained clamor in the literature that more attention be paid to values in principle preparation programmes (Cruz-Gonzalez et al., 2019), but also, and importantly, “throughout the professional life of principals” (Nordholm et al., 2020, p. 347) (see also, Angelle, 2017; Bezzina and Bufalino, 2019; Bird et al., 2013). However, it is important to add that attention to values is not merely a matter of articulating mission and vision statements that frequently reside in the limbo or no-man’s-land of school websites, but to recognize also that principals “are expected to be ‘moral leaders’” and since “some principals may not have sufficient access to skills to confront the ethical and critical challenges of their profession” appropriate pedagogical and leadership preparation is warranted (Cruz-Gonzalez et al., 2019, p. 325).

School leadership and identity politics?

Such a focus on values, however, and how they influence thought, deliberation and action, has become fraught and fragmented due to the exponential focus on “identity politics,” fueled in recent times by a combination of #Me Too, Black Lives Matter, and “group affinity” that is fired and facilitated by a variety of social media platforms, thus also a shift in emphasis to “group membership rather than individual rights and responsibilities” (D’Ancona, 2020, pp. 9–10). The reality of identity politics has seeped into leadership research, simultaneously providing both anchoring as well as complicating influences, the latter more disempowering rather than fueling a sense of agency. For example, Tricia, a black principal in Toronto, recognizes the significance of her own biography in the following:

I must be interested in social justice and equity because of who I am ... sometimes you’ll hear people say, “But that’s not important to me, I’m black, but I’m not affected.” But I think that’s nonsense (Tricia).

Armstrong and Mitchell (2017, p. 829).

For both principals in this Canadian study, there is recognition that there are inevitable tensions between jousting with and juggling different identities, simultaneously “authoring and effacing identity” but crucially also “standing up and standing tall for personal and professional values” (Armstrong and Mitchell, 2017). In the context of this chapter, these principals recognize the dynamic between what is identified as the “public persona” (professional) and the “shadow persona” (personal), an ongoing tension between the desire to “fit in” while simultaneously wanting to be allowed the space and opportunity to “be myself” (Armstrong and Mitchell, 2017, p. 835). In similar vein, others too have claimed “it is important simultaneously to recognize the impossibility of escaping the personal and the situational” (Sugrue, 2015a, p. 15). Consequently, recognition of the increasing complexity of the principal’s role has spawned “multiple identities” (embracing “problem solver, guardian of culture, change agent, advocate, or mediator”) (Notman, 2017, p. 760), while such shattering of the self has encouraged others to argue that in such circumstances, there is a desire if not a craving on the part of school leaders to “create in their relationships with others ... a sense of coherence, worth and belonging” (Lumby and English, 2009, p. 95). Added to this complexity, a vein of research on leader emotions, while important, has potential also to create further fragmentation and vulnerability through greater exposure due to social media (Gavish and Oplatka, 2012). In recognition of the demands of the role creating an emotional roller coaster, efforts have been made to find some “situated certainty” (Hargreaves, 1994) in such fractured circumstances—resulting in “the PIVOT framework—Purpose, Identity, Values, Options and Trust” as a means of explaining “current leaders’ practice and development” (Cain and Gunter, 2012, p. 187). At the risk of being accused of a reductionist perspective, or an overly simplistic approach to leader formation, we argue that the fundamental pivot between the professional and the personal results from a manifestation of “moral integration” (Coles, 2000) through which a degree of continuity and coherence is found; finding “legitimate compromise” between competing priorities and values (May 1992, 1996).

When the discrepancy between personal values grate and grind against the values embedded in policy prescriptions that fail to recognize or accommodate particular school and community contexts, there is increasing evidence that due to the changing nature and increasing complexity of the principal’s role, there is growing attrition, and, depending on its frequency, with negative consequence for community, continuity and stability, as well as student learning and achievement (Mascall and Leithwood, 2010). Similarly, when framed within a milieu of “school improvement” and “policy enactment”, as concluded in the following, these concerns cannot be separated from “connection with the values and biographies of the principals and actors at all levels of the system” (Day and Gu, 2018, p. 342). Additionally, further research confirms this intimate relationship, when it states: “school principals, ...as educators” not only require a “strong moral purpose” but that such a set of values is both “a critical antecedent and co-requisite” of their capacity for effective practices” (Crow et al., 2017, p. 265).

The “character” of leadership: leader formation

In order to advance research, as well as the argument of this chapter, and in the interest of being inclusive and comprehensive in our approach to leader formation, we understand that multiple identities, the responsibility to care, trust and challenge, often simultaneously, is the ongoing “crucible” (Bennis and Thomas, 2002) in which leaders find themselves, not merely as an entré or initiation into the principal’s role; closer to Dante’s *Inferno*, when there are days that seem like real “purgatory,” while others harbor significant psychic rewards, and though not entirely “paradise,” as Dante would have it, render the role worthwhile and rewarding. It is such experiences that re-form (repeatedly) the character of leaders. When as academics we are invited to provide references in support of a colleague’s application, typically for a promotion, in addition to their capacities, and accomplishments, almost invariably there is a request to comment on their “character,” their communication skills, disposition, and evidence of collaboration, given the increasing significance of the latter for leadership (Leithwood et al., 2019). While cumulative evidence over time regarding “successful school leadership” has identified significant characteristics of “good” leaders (Leithwood et al., 2006) what is not predictable is how such qualities become embedded in the leader; that requires the ongoing work in the crucible where personal and professional contexts continuously encounter one another. This work extends over a rather wide spectrum of activities and engagements for teachers and leaders, embracing:

... professional and personal–professional activities beyond the immediate pedagogical or administrative. From formal and sustained programmes of higher degree study and certified participation to decidedly informal and oftentimes fleeting undertakings increasingly pursued in the unregulated environment online.

O’Brien (2018, p. 229).

Across this range of activities there are varying degrees of an “ethical relation” as well as a “relation of power or government” often articulated in policy texts (O’Brien, 2018, p. 230). In informal settings, individuals have the courage to speak freely and uninhibitedly, while in formal gatherings, the requirement for self-government is felt more keenly. When the external environment, the immediate context of the school and/or national policy, is experienced as demanding or even coercive, governance of the self becomes considerably more circumspect. In such circumstances, the “enfolding” of self-governance may induce compliance and conformity rather than, the courage to “stand tall” as articulated above. The notion of “the fold” or the process of enfolding, where self (personal) and governance (professional context) continually meet is what O’Brien (2018, p. 231) identifies as “The pocket of ‘interiority’ [that] ... produces ... the zone of the self, simultaneously ‘inside’ and ‘outside’”. In this zone, the self, and what it stands for is continuously remade as it encounters the realities of professional life within the school community, the dynamics of which he

captures in the following: “practices of the self and practices of government might be better regarded as hybrid ones and might, more accurately, be described as ethical-governmental practices” (O’Brien, 2018, p. 232). However, maintaining the ethical element of this tension, necessitates moving beyond the language and logic of accountability, and to reach for the language and logic of professional responsibility which necessitates a moral dimension (Solbrekke and Sugrue, 2011). Thus, in order to vindicate one’s personal values, as they become enfolded in governmental requirements, as part of the process of re-constituting the personal and professional, it is necessary to seek out legitimate compromise (May, 1992). A note of caution however is warranted since research demonstrates the autonomous ‘new professional’ is subjectified to embody a neoliberal subject in practices of self-formation (Anderson and Cohen, 2015; Cohen, 2014; Gobby, 2013). Consequently, to vindicate one’s professional responsibility, resistance rather than compliance to governance requirements may feature prominently in the process of enfolding, thereby enabling the evolving self to embody moral considerations. Accordingly, it is timely to turn attention to a notion of “ethical work” (Foucault, 2000b) that is particularly apposite to explicate such a processes.

Foucault’s concept of ethics

Foucault’s work has proved beneficial in the area of educational leadership since it provides insight into ways in which school leaders are subjected to (Mifsud, 2016, 2017; Niesche, 2011), and to a lesser extent resist (Dolan, 2020; Niesche, 2011), the influence of discourses emanating from NPM. Consequently, the use of his oeuvre in research pertaining to educational leadership has become “an established approach” (Heffernan, 2018, p. 511). Generally speaking, the term ethics is used to refer “to well-founded standards of right and wrong that prescribe what humans ought to do” (Velasquez et al., 2013). Foucault, however, advanced a concept of ethics that centers upon the relationship that a person has with oneself to behave in a moral manner. This latter notion of ethics provides a useful means of illuminating the interplay between the personal and professional in the enfolding that underpins the character of leadership. To explicate this further, we focus on Foucault’s notion of ethics, its relationship with moral codes and acts.

Moral codes and acts

Foucault uses the term moral codes to refer to sets of prescriptions that determine which behaviors of people are permitted and forbidden and ascertain the positive or negative value of different possible behaviors (Foucault, 1977, 2000b). For example, the idea that people are not allowed to commit adultery is an element (prescription) of a moral code. In effect, moral codes are sets “of values and rules of action that are prescribed by agencies such as the family, educational institutions and churches” (Niesche, 2011, p. 37). The Bible, Koran and educational leadership policy documents typify texts that set out moral prescriptions. In view of this, ethics can be seen as originating from an individual’s interpretation of such moral codes.

Ethics is concerned with this relationship an individual has with him/herself in terms of interpreting how one should behave to consider themselves as acting in a moral fashion (Foucault, 1992, 2000b). Additionally, Foucault uses the word acts to denote, for example, the way a principal determines how the code concerning distributed leadership should apply to himself or herself culminating in his/her actual behavior in cultivating it, or not. Hence, ethics can be viewed as the process through which an individual determines the physical enactment of their philosophical code.

Foucault’s key aspects of ethics

Foucault suggests that this process of ethical conduct has four major aspects (Foucault, 1992; 2000b). One of these he terms “ethical substance” which can refer to, for example, a person’s acts, desire or feelings (Foucault, 2000b, p. 263). It denotes the part of an individual that they themselves must refine as the “prime material” of their moral conduct (Foucault, 1992). For example, with the ancient Greeks it was moral for a man to be in love with a boy so long as he did not touch him, whereas for early Christians, it was immoral to even desire a boy in such a manner (Foucault, 2000b). Hence, the ethical substance that informed the ethical judgment of the ancient Greeks concerned acts while for early Christians it centered upon desire. In a complex, relativist plurality of values faced by contemporary school leaders, the character of their leadership is forged and burnished through finding legitimate compromise between their values and those inherent in policy mandates, in the absence of which resistance becomes a moral obligation.

Foucault also draws attention to what he calls “mode of subjectivation ... the way in which people are invited or incited to recognize their moral obligations” (Foucault, 2000b, p. 264). It concerns the way in which an individual establishes their relation to a rule and recognizes himself or herself as obliged to implement it (Foucault, 1992). It alludes to the factors that influence individuals to accept and comply with their moral obligations. It could refer to divine law in a text such as the Bible or Koran (Niesche, 2011; O’Farrell, 2005), policy documents by an education authority (Niesche and Haase, 2012), to make one’s life an example to others, to be a role model (Foucault, 1992; O’Farrell, 2005) or criteria inspectors use to judge schools (Gillies, 2013). For example, a principal might advance a policy reform initiative to enhance the educational experiences of students, while another might do so to receive favorable rank from the Inspectorate; the latter being a less worthy value espousal, although Foucault avers that one’s mode of subjectivation is premised upon “a personal choice” (Foucault, 2000b, p. 266).

An additional aspect which Foucault refers to as “self-forming activity” relates to the means by which a person attempts to change themselves in order to behave in a moral fashion to achieve their ethical aspiration (Foucault, 2000b, p. 265). Such steps could include physical and mental techniques such as fasting or only eating certain types of food in the area of diet (O’Farrell, 2005), principals undertaking administrative work outside of school hours (Niesche, 2011) or school leaders participating in Continuing Professional Development (CPD) activities (Gillies, 2013).

Yet another dimension of this ongoing character formation or subjectification/exercise of agency for Foucault he terms “telos”, which is “the kind of being to which we aspire when we behave in a moral way;” an individual’s idealized notion of themselves as a moral person (Foucault, 2000b, p. 265). It relates to achieving “a certain mode of being, a mode of being characteristic of the ethical subject” (Foucault, 1992, p. 28).

The empirical section of this chapter indicates and illustrates how senior school leaders bring together the public and shadow persona, forging legitimate compromises as integral to the ongoing development of their ethical character.

The character of leadership: ethical work as a basis for praxis

The empirical data reported here draws selectively on a multi-site case study conducted across 12 second level schools in Ireland. While this research embraced interviews with senior school leaders - principals and deputy principals - and teachers at each of these schools, illustrative data are presented to showcase different dimensions of the leadership character formation of three school leaders in specific professional contexts. Notably, the associated national context, emulating those of a variety of jurisdictions across the globe (Apple, 2006, 2013, 2014; Mac Ruairc, 2010), is characterized in significant ways by the influence NPM agendas (Ball, 2016; Sugrue, 2015b). What follows is an exploration of how values of senior school leaders and the professional contexts in which they are situated meet, are juxtaposed, yet coalesce as constituents of their emerging “ethical substance”, that is their leadership formation (Foucault, 2000b).

Standing for the common good

The first example of enfolded transpired at a fee charging school, one at which the focus on student attainment in the government Leaving Certificate examination (end of secondary education) was particularly pronounced. It centered upon a letter from parents that the deputy principal there was asked to endorse, which sought an “accommodation”¹ for their son for said examination. To give a “flavor” of the kind of things he was “dealing with on the hoof” (Deputy principal, School A), this deputy principal mentioned that while he was on the corridor earlier that morning, the career guidance teacher had shown him a letter from the parents in question seeking the aforementioned accommodation. Regarding this letter the deputy principal stated:

... they wrote things about [their child] being a victim of bullying for six years and so on which are categorically untrue... To be quite blunt they’re lying in the hope of getting an accommodation for him... I understand that any parent will kind of try anything to get what they think will help their child, but we can’t allow them to say these things. I mean if they’re true, fine, let’s deal with them... To my mind it is clearly an attempt just to use sympathy and so on but we can’t stand over that. We certainly can’t endorse what’s in our opinion a complete lie. You know it’s wrong... I wouldn’t turn a blind eye and say, ah he’s a good kid and if this helps him get it.

Deputy principal, School A.

This citation illustrates the complexity of the, frequently fleeting (O’Brien, 2018), competing and conflicting personal and professional demands that are imposed on school leaders by both themselves and the professional contexts in which they enact their roles. It confirms that the parents in question had submitted a dubious letter for the school to endorse possible enhancement of their son’s leaving certificate results and in so doing were “playing a sympathy card” to influence the deputy principal to achieve this. Moreover, it demonstrates that he was able to empathize with the parents’ desire to support their child, whilst also being aware that a person in his position could be swayed in the matter to help a “good” student. Hence, the decision-making process for the deputy principal did not just center on whether, or not, the assertions being made in the letter were legitimate, as other potentially mitigating factors were at play.

In the above instance the deputy principal resisted the temptation of succumbing to the pressure from the parents, which bodes well for the character of his leadership. To understand how and why this enfolded as it did, Foucault’s notion of ethics is most useful. The citation below is pertinent as it clarifies associated elements of the deputy principal’s “telos” (Foucault, 2000b) of himself as a good leader and his “mode of subjectivation” (Foucault, 2000b) - which in general terms alludes to

¹An “accommodation” refers to additional support that may be granted by the Ministry of Education to facilitate access to the certificate examinations by students who would have difficulty in accessing the examination and/or communicating what they know and/or can do due to an examiner consequent to a physical and/or visual and/or learning difficulty.

the factors that influence individuals to accept and honor or live up to their moral obligations – in choosing the leadership response he did, over possible alternatives. In referring to the possibility of endorsing the aforementioned letter from parents, the deputy principal stated:

Legally we could even be vulnerable to a case later; ... you endorsed it [the letter] when you sent it off to the Department. You basically accepted it's true... If we sent that off now in the envelope today and pretend we didn't see it or collude with it, the chances are it would never come back and bite us. The boy might get his "accommodation" or it might be to his benefit, but it's wrong and also it would disadvantage let's say a girl in another school who didn't get a course because he got an accommodation he didn't deserve under false pretences. So, you know, morally I couldn't stand over it. I'm not making myself out to be the most moral person in the world but there has to be some kind of sense that this is acceptable and that's not acceptable.

Deputy principal, School A.

When this quotation is considered in conjunction with this deputy principal's previous one, it is evident that he knew that if the school were to endorse the letter it would be validating its assertions, including one that the student in question was a victim of bullying at the school for six years, and could therefore have a legal case taken against it. The above citation also confirms that the deputy principal was aware that he could endorse the letter to the benefit of the student and that this course of action would be unlikely to culminate in adverse repercussions for the school. However, while he was aware of these scenarios, they were not crucial in guiding his decision. On the contrary, it can be deduced from his statement, "there has to be some kind of sense that this is acceptable and that's not acceptable" that it was premised on his *telos* that good leadership must reflect certain moral standards. Specifically, it was his view that, simply put, "it's wrong" to endorse false claims for an accommodation and that to do so could result in inequalities in access to further education for students elsewhere in the country.

The deputy principal's leadership formation (ethical substance), which resulted in his decision not to endorse the letter, was contingent upon his personal values that a good educational leader (*telos*) must embody certain standards of right as opposed to wrong and be fair to students across schools in terms of progression to further education (mode of subjectivation). As such, in engaging in "ethical work" (Foucault, 2000b) his personal values, consistent with extant research (Campbell et al., 2003, p. 205), played a crucial role in his leadership formation, evidence of professionally responsible leadership praxis combining values and reflexivity (Solbrekke and Sugrue, 2020). In the face of conflict between his personal values and professional context, he stood up and stood tall (Armstrong and Mitchell, 2017) for the common good.

Values and accountability: professionally responsible leadership-formation

A second example of discord between the values of a senior school leader and professional context manifest itself at School B, where parents, by virtue of the privilege they ascribe to having their children taught by excellent teachers, sought to encroach on the potential appointment of a teacher for secondment to a non-teaching position at the school. This conflicted with the principal's moral aspirations regarding such appointments. Foucault's key aspects of ethics are useful in illuminating the key factors that influenced his associated leadership formation.

A key feature of the principal at School B's "telos" (Foucault, 2000b) of a good principal incorporated the notion that teachers should be appointed to positions on merit. This can be deduced from the rationale he articulated for selecting a teacher for appointment to a post of responsibility (a middle management role) to promote academic excellence at the school. He stated that the teacher in question

... is very enthusiastic about ... promoting academic achievement... and ... I know it's something she's passionate about. She got a prize relating to her subject a number of years ago for the top leaving cert result in the country in a particular year. The top A1 was one of her students ... and she's the ideal person. She's also a very senior member of staff, well respected! I certainly feel that staff members would take her in that role very seriously.

Principal, School B.

This indicates clearly that the principal had selected the teacher in question to undertake the role of promoting academic excellence as she had exemplified characteristics that suggest she would undertake it competently. Thus, it can be appreciated that appointing teachers to positions on merit formed part of his *telos* of a good principal. However, the professional context that arose consequent to the perspectives of parents regarding another appointment at his school was at variance with his meritocratic values.

The issue with this particular appointment arose when several teachers at School B applied for secondment to this non-teaching position, including one whom the principal described as "a particularly strong teacher ... The teacher would probably be the best teacher in the school. Absolutely, and ... we have some very talented ones, so absolutely excellent" (Principal, School B). He recognized that if this teacher were to be appointed to the seconded position it would be, as he put it, "a huge loss from the teaching staff ... and [I] knew then of course there was going to be a backlash from parents" (Principal, School B). This citation indicates that parents at this school would have preferred if the excellent teacher in question was not appointed to the seconded position, a perspective, as evidenced by the interview data, underpinned by their desire to maximize their children's leaving certificate results. The quotation also confirms that if the excellent teacher was appointed to the position, the specter of reverberations from parents

loomed large. Thus, the principal's meritocratic values in respect of appointments were in direct conflict with pressure emanating from parents to privilege their children's interests.

In connection with the above dilemma, the principal clarified his associated "mode of subjectivation" (Foucault, 2000b) - the factors that incited him to "stand by" his moral obligations - in stating:

I really had to make a decision that I couldn't allow, and I was tempted, but I couldn't allow that teacher to be penalised almost for being exceptional and that's what it would have amounted to if that teacher hadn't got that role. She would have been penalised because she was just so good and so committed ... so she was appointed to the position.

Principal, School B.

This highlights the gravity of the situation for, not just the excellent teacher and the principal's leadership formation as the latter "was tempted" not to appoint the former to the position but, also, regarding the positive impact she could have as an excellent teacher in cultivating excellence among colleagues, thus raising standards across the school. Additionally, it reveals the principal's mode of subjectivation centered on resisting the influence of parents as this would have involved short-changing a teacher for excelling, a values position he was unwilling to be compromised on. Crucially, evoking his mode of subjectivation in this way was premised upon a "a personal choice" (Foucault, 2000b, p. 266) to honor his meritocratic values while resisting being "disciplined" (Niesche, 2011) by the influence of parents. His shadow persona influenced his professional decision.

Acting in a professionally responsible manner played a significant role in enabling the principal subsequently to defend the moral integrity of the appointment process as there was a backlash from parents, whom in his words were "very concerned and questioned me" (Principal, School B). However, he had engaged in a "self-forming activity" (Foucault, 2000b) - steps taken to conduct himself in a moral fashion - which enabled him to respond to them and achieve his ethical aspiration, as illustrated:

My response to them at the Parents' Association meeting was ... that I advertised, I interviewed, and I sourced an excellent ... very highly qualified teacher to fill that vacancy and the teacher in question didn't relinquish her teaching duties until the newly appointed teacher started and there was an appropriate hand over. And I feel I am very well covered ... but that's an element of accountability.

Principal, School B.

It suggests that the appointment process complied with relevant policy requirements, an accomplished teacher had been appointed to replace the one being seconded and there had been an appropriate "hand over", thereby alleviating potential concerns parents might have in respect of their children's academic attainment. Thus, through his "ethical work" (Foucault, 2000b) premised upon upholding meritocratic values (telos) in a professional context that privileges measurable outcomes of students, conducting the appointment process, not merely in an accountable but a professionally responsible manner (self-forming activity), consistent with his personal values-based choice (mode of subjectivation), the principal's leadership character (ethical substance) was enfolded (O'Brien, 2018).

Consistent with extant research (Crow et al., 2017), personal values-based choices are pertinent to leadership formation in the contemporary era, whereby senior school leaders must choose between their moral values and values inherent to educational environments characterized by NPM influences. Moreover, it is evident that in such predicaments they can exercise a "degree of freedom" in determining their acts (Foucault, 2000a), even fusing personal values and accountability, thus acting in a professionally responsible manner while simultaneously cultivating the moral character of leadership.

The crucible of leadership character formation

The values of senior school leaders pertaining to inclusive education are concerned with both the academic and social development of all students and enable us to shine additional light on leader's character formation (Ainscow et al., 2019). Inclusion policies validate the plurality of difference within and across students (Booth and Ainscow, 2016) but contexts vary in their receptivity to such policy prescriptions, as the following example illustrates. As indicated by the deputy principal in School C, the progress of first year students was of concern due to student behavior in the associated "mixed ability classes", with the result that "teachers were overwhelmed by this situation" (Deputy principal, School C). Consequently, to address the situation for future years she led an initiative that culminated in the decision that, thereafter, for first year classes the "top two classes will be streamed and the bottom two classes will have mixed ability" (Deputy principal, School C). Further, she indicated that for a group of incoming first year students whose conduct reflected the misbehavior of their current first year cohort, a "transition program" had been developed whereby such students will have their own classroom and experience an alternative curriculum tailored specifically for them. Hence, the deputy principal was responsible for leading change from allocating students, upon entering the school, to "mixed ability" class groupings to employing hierarchical arrangements in the form of "banding" (Ireson and Hallam, 1999). Research suggests the use of such hierarchical approaches have adverse effects for some students thus run counter to the philosophy of inclusive education (Boaler et al., 2000; Gillborn and Youdell, 2001; Ireson and Hallam, 2009; Ireson et al., 2005; McGillicuddy and Devine, 2020; Smyth, 2018). The application of Foucault's concept of ethics that follows reveals that, even if it fell somewhat short of an inferno, the

associated enfoldings of the self (O'Brien, 2018) placed the deputy principal's values at odds with her leadership formation in a no-win situation in an era of austerity.

Empirical data indicate that the Deputy Principal at School C's "telos" (Foucault, 2000b) of herself as a good deputy principal incorporated the notion she should promote inclusive education. Indeed, she accorded this facet of her telos a high priority as evidenced by her statement, "one of the things that I'm most proud of" is the school is catering for students "from all sorts of diverse backgrounds" (Deputy principal, School C). Consequently, her "ethical substance" (Foucault, 2000b), the prime part of herself that she must refine regarding fulfilling the above facet of her telos, is her leadership formation. Thus, at a cursory glance it appears that she ought to have promoted the use of mixed ability as opposed to banding as the basis for forming first year classes to consider herself to be acting in a moral way. However, further examination of her engagement with ethics verifies this as an overly simplistic interpretation of the situation, as her leadership formation was complicated by other factors.

In respect of the Ministry's policy promoting inclusive education, she stated:

I'm one hundred percent supportive of it but sometimes it's not achievable because we don't have the resources to reach those ideals... I think, for example, our mixed ability might be a much more pleasant experience for students and for teachers ... if we had more resources for our students in terms of attaining their educational potential, the best that they can do, with extra trained people in a classroom. Then, I think that would really help us live the idea of an inclusive school.

Deputy principal, School C.

While the above confirms the deputy principal's endorsement of inclusive education policy and her commitment to having it reflected in the lived reality at her school, it also asserts that from an organizational perspective, the formation of classes based on mixed ability is, in and of itself, insufficient for students to experience inclusive education within such classes, as this can fall short in terms of the pleasantness of the associated educational experiences for both students and teachers. Indeed, the educational outcomes of students would undoubtedly suffer too when, as previously cited, teachers are "overwhelmed" in such settings. Accordingly, the realization of inclusive education within mixed ability classes for first year students at School C would have been contingent upon the allocation of additional resources to the school for team teaching within such classes. Notably, at the time the school had lost significant personnel and middle management resources arising from cutbacks in education at national level (Drudy, 2009). Thus, in the professional context in question, realizing the deputy principal's ethical ambition was not as simplistic as choosing between operationalizing mixed ability that would enable students to experience inclusive education or employing banding that would militate against its actualisation.

On the contrary, on the one hand the character of the deputy principal's leadership could have embraced the continued use of mixed ability as the basis for class formation. The associated "mode of subjectivation" (Foucault, 2000b) would be consistent with the deputy principal's ethical aspirations in respect of inclusive education from an organizational perspective but would, due to a lack of resources, fall short of enabling students to achieve appropriate levels of educational attainment in a suitable environment. On the other hand, the deputy principal's leadership formation could have been characterized, as it was, by the introduction of banding. Thus, her "mode of subjectivation" (Foucault, 2000b) conflicted with her ethical ideals from a class formation perspective due to concomitant adverse social (Smyth, 2018) and psychological effects for students (Ireson and Hallam, 2009; McGillicuddy and Devine, 2020), while it would be more likely to yield higher levels of academic attainment for some students (Ireson et al., 2005; McGillicuddy and Devine, 2020). The decision taken in the circumstances might not be regarded by all readers as a "legitimate compromise" (May 1992) between the deputy principal's endorsement of inclusion as a policy and the possible negative consequences of her decision for some learners, but in the crucible between choosing between the wellbeing of her teaching colleagues, the progress of some learners or adverse effects for both teachers and the entire student cohort, resistance to the policy in the circumstances seemed to her legitimate. In a time of austerity, securing additional resources was not an option. However, values conflicts sustained over time contribute to "corrosion of character" and burnout (Sennett, 1998).

Concluding discussion

The character of leadership is not just something "out there" to be aspired to by leaders, described in mission statements but otherwise largely ignored. What this chapter has endeavored to demonstrate is that the character of leadership is embodied, it is enfolded into the public and shadow persona of leaders, their ongoing formation. The particular examples we provide as illustrative of this ethical process reinforces the view that leading has an inescapable moral dimension. This indicates the extent to which the moral fabric of education systems is contingent upon the "ethical work" (Foucault, 2000b) of senior leaders in particular, but extends to all members of the school community. This ethical imperative is supported by extant literature that highlights the importance of ensuring that ethical leadership formation receives due recognition in leadership preparation programmes (Cruz-Gonzalez et al., 2019).

Moreover, ethical decision-making requires a degree of professional autonomy to choose one action over another since "freedom is the ontological condition of ethics" (Foucault, 2000a, p. 284). However, due to the complexity of the principal's role, the policy constraints and contexts in which they are obliged to lead, frequently necessitates "legitimate compromise" (May 1992) that includes reflexive consideration of the way s/he has decided to act. The ethical considerations indicated in this chapter

are deployed by senior school leaders as they enact their responsibilities. They are part of their deliberations, and reflections as integral to their character formation, while seeking to act in an ethically appropriate manner. The enfolding of values into character formation in the everyday lives of school leaders evident above, lends legitimacy to resistance to those policies that violate the personal and professional sense of self, and where legitimate compromise remains out of reach. Rather, it calls for a more “deliberative leadership” that recognizes both the shadow and substance of leadership practice, while, through reflexivity seeks to elevate it to a sustainable praxis (Sugrue and Solbrekke, 2020).

Glossary

IEB governor (Independent, External, Business-based governors) An individual from the business sector who sits on school governing body

MAT (Multi Academy Trust) An academy trust that is directly funded by the government and that more than one academy school

NED (Non-Executive Director) An independent director who is a member of a MAT's governing body

Ofsted (The Office for Standards in Education, Children's Services and Skills) A non-ministerial department of the UK government that is responsible for inspecting educational institutions

Introduction

In this article, we conceptualize the governing body (GB) of a school as a “diverse landscape of practice” (Wenger-Trayner and Wenger Trayner, 2014), bringing together individuals with different knowledge sets to improve outcomes for children and young people. This diversity has been accelerated within the global context of neoliberalism, with government policy at national level decentralizing school governance in a wide range of countries, including Japan (Lin and Wu, 2013) and Portugal (Viseu and Carvalho, 2018). Schools are required to run themselves as businesses and those that are successful against performance criteria are rewarded financially (Ball, 2003), meaning that the skills of the business sector have become key part of the diverse landscape of practice of GBs globally.

This global move toward the involvement of the business sector in school governance is explored in this article through research which took place in England. Here a 20-year policy shift toward encouraging schools to become financially independent has led to an emphasis upon appointing individuals from the business sector to school GBs (Balarin et al., 2008, p. 58). This article brings together previously analyzed data (Dobson et al., 2020; Dobson and Rose, 2019), which was collected as part of an 18-month evaluation of a banking group's school governance volunteering program. The program involved Lloyd's Banking Group (LBG) recruiting their staff to become independent, external, business-based governors (IEBs) in the North of England where schools were either underperforming, experiencing governor shortages, or both. The evaluation focused on the early experiences of 18 IEBs as school governors, highlighting both the barriers and the facilitators that shaped their participation in a new and diverse landscape of practice. In order to capture their development, the data collected includes four interviews with each of the 18 IEBs at different stages of their first 18 months of tenure, as well as interviews with key stakeholders (Headteachers, Chair of Governors, Business Managers) in each school at the end of the evaluation.

Set against research which claims that governors from the business sector marginalize the contributions of other GB members (Young, 2016, 2017), the analysis of this interview data identifies a different type of participation from these IEBs—rather than marginalizing the contributions of others, IEBs were often tentative in their participation, aware of the need to learn from the experiences and knowledge sets of the other governors in this new and diverse landscape of practice.

Given our dependency upon online communication as a result of the COVID-19 pandemic, the analysis of the interview data is timely because 5 of the 18 IEBs were recruited as “e-governors”. This meant that they were expected to attend GB

meetings remotely, allowing them to be part of a GB in schools which traditionally struggled to recruit IEBs due to their remote location. The analysis of the interviews of the 5 e-governors and their schools' stakeholders highlights the affordances and barriers of IEBs participating remotely. While all e-governors were able to contribute to their respective GBs, notably in relation to improving the schools' business practices, the barriers they experienced were significant. These included operational barriers, for example accessing remote training and remote meetings, as well as relational barriers, namely building social relationships with other GB members in order to participate in a different and diverse landscape of practice. In a post-pandemic context, these operational and relational barriers can now be thought about more widely as schools (and businesses) engage more readily with technology.

Policy context

As indicated above, the decentralization of the running of schools can be seen as part of global neoliberalism. In England, where this research took place, the process of decentralization of schools began in 2001 when New Labor introduced the first academization of schools program for failing schools and it is reflected in more recent legislation to ensure that schools have a professionalized GB that offers technical expertise and secures performance evaluation to improve public service delivery (Wilkins, 2015: 182). In England, therefore, a GB is no longer positioned simply as a "critical friend" but is responsible for the three core functions: ensuring clarity of vision, ethos and strategic direction; holding the Headteacher to account for the educational performance of the school, its pupils and staff; and overseeing the financial performance of the school, making sure money is well spent (DfE, 2015: 7).

In line with this and in line with the technologies of neoliberalism, in 2013 the government inspectorate (The Office for Standards in Education, Children's Services and Skills—Ofsted) significantly raised demands in terms of GBs (James et al., 2013), and the latest Ofsted inspection handbook (2018: 29) emphasizes the importance of a high performing GB: "the contribution of governors to the school's performance is evaluated as part of the judgment on the effectiveness of leadership and management". In England, a school cannot be rated "outstanding" if its GB falls short on any of criteria against which it is assessed. School GBs should include individuals with business expertise and the following skill-sets: knowledge of the legal sector in a number of different areas; the ability to manage processes; the experience and knowledge of running a business; and finance and leadership. Such skill-sets are often associated with the private sector. Running a school is now akin to running a business (Wilkins, 2015: 188).

In the North of England where the research took place, the government launched the "Northern Powerhouse" agenda in 2014 to challenge economic underperformance in the region (Clifton et al., 2016: 7). Initially the focus was transport and connectivity but this later widened as a result of a report from the Institute for Public Policy Research North (Clifton et al., 2016), which stated that if the North is to succeed in reaching and sustaining its economic potential, educational disadvantage must be "at the heart" of transformational objectives. This was based on data which indicates the workforce in the North of England is lower qualified than the national average (Clifton et al., 2016). According to Ofsted (2015: 11), 75% of all failing secondary schools are in the North and the Midlands.

In relation to school governance, the challenges facing GBs are greater in areas of socio-economic disadvantage (James et al., 2011: 415) like Yorkshire and Humberside, the specific region in the North of England where this research took place. One of the ways in which improved educational standards for all pupils can occur is by GBs appointing individual members with the appropriate skills, knowledge and experience to help drive schools forward. Yet the National Governance Association's most recent report (NGA, 2020) demonstrates that in England schools are increasingly struggling to recruit governors and that this is most pronounced in Yorkshire and Humberside, where 65% of schools have struggled to recruit to their GB.

LBG's school governance volunteer program, therefore, should be viewed as part of the wider Northern Powerhouse strategy and is particularly focused on Yorkshire and Humber, with 80 out of their 400 IEBs recruited in this area. Given that 25% of new governors claim to have had no training in their first year of governance (NGA, 2020), it should be emphasized that LBG's offer encompasses recruitment and training through the establishment of their National Governors' Network, which seeks to provide IEBs with the tools they needed to support their schools. This includes dial-in webinars during working hours to address particular topics relevant to school governance.

LBG's offer in Yorkshire and Humber also targeted "cold spots" in the region where rural or coastal schools were finding it difficult to recruit governors due to their remote locations. Here LBG piloted IEB governors who would dial into meetings rather than attend in person. LBG provided schools with sound and vision technology to facilitate this. At the start of the evaluation, ten remotely operating IEBs were recruited, five of whom took part in our interviews.

Business sector involvement in school governance

Despite recent policy changes to school governance in England, there is a lack of research into how business volunteers develop into their roles as school governors. This lack of research is surprising, however, when the results of an extensive evaluation of GBs undertaken prior to recent policy changes is taken into account (Balarin et al., 2008). In their evaluation report, the second aim of which was to "review the business contribution of governors", Balarin et al. (2008: 58) undertook a survey with over 3000 governors from

different backgrounds, 80% of whom agreed that the expertise of governors primarily recruited for their business expertise was “crucial to the running of the schools”. Given the quantitative nature of the evaluation, however, what is unclear is why and how the business community’s contribution to school governance was held to be crucial and whether it was particular stakeholders who tended to hold this view.

Instead of exploring the reasons behind the positive contribution of the business sector to school GBs, subsequent research into governance has focused on the negative effects of policy change. Connolly et al. (2017) literature review evaluates the effectiveness of the new skills-based model of governance as opposed to the traditional, stakeholder model where members of the GB are elected to reflect the composition of the school’s local community. While acknowledging the need for GBs to be more skills-based in terms of their composition in light of policy changes, Connolly et al. (2017: 17) conclude that “the stakeholder approach to school governance continues to have much merit as it affords a degree of authenticity to those representatives as well as a degree of independence not easily replicated in the skills based approach”. By authenticity, Connolly et al. (2017: 6) mean that the GB representatives have a genuine “interest” in their schools.

The idea of a skills-based model of school governance as a threat to the stakeholder model is articulated further by Young in research articles (2016, 2017) based on her Ph.D. thesis (data collected in 2011/12). Drawing upon semi-structured interviews and observations in four schools as well as wider policy critique, Young identifies how the rise of a skills discourse in policy serves to create a false “skills/representation binary” (Young, 2016: 170). This binary is further explored in a later paper (Young, 2017: 42), which interestingly draws upon theories of “deliberative democracy” to conceptualize GBs. Here the focus is on the nature of “expert” knowledge and how this knowledge interacts with “lay” knowledge throughout decision-making processes in a GB. While emphasizing the “slippery” nature of knowledge types, here Young (2017: 42) differentiates between two forms of “expert” knowledge at play within a GB—“educational” and “managerial”.

Young’s key finding is that “lay” knowledge is both marginalized and co-opted by “managerial” knowledge and she identifies three key reasons for this. Firstly, within a wider context of neoliberalism where education becomes an auditable product (Ball, 2003), managerial knowledge is privileged as the business of the GB becomes primarily associated with “compliance-checking” and “accountability” (Young, 2017: 52)—a point further developed by Wilkins (2016: 112), who views the “performative accountability” of the neoliberal education system as promoting “calculative technologies” which play to the skills and discourses of the business sector. Secondly, in recognizing the value of educational knowledge as expert knowledge, managerial knowledge “lays claim” to educational knowledge (Young, 2017: 53). And finally, because lay knowledge tends to be associated with “vague conceptions of common sense” (Young, 2017: 42), managerial knowledge co-opts conceptions of “common sense” leaving little space for lay knowledge to be articulated.

This article and the analysis of the data generated for the evaluation directly respond to Young’s findings. In doing so, this article also addresses a gap in the research literature to capture the experiences of IEBs as they begin in their roles on school GBs. In order to think about how the IEB governors developed in these roles, I draw upon the theoretical framework of Wenger-Trayner and Wenger-Trayner (2014) who view professional development as occupying specific “landscapes of practice”. For Wenger-Trayner and Wenger-Trayner (2014: 19), professional identity and associated knowledge results from participation in landscapes of practice which have three dimensions—“flat”, “diverse” and “political”. Here, they see “flat” as the everyday experiences of a group of professionals who experience their landscape as a predictable and taken for granted normality. GBs, however, are comprised of a “diverse” group of individuals who, depending upon the landscape of practice they experience outside of their governance roles, will find themselves participating by drawing upon knowledge which, according to Young (2017), is either educational, managerial or lay. The lived experience of individuals within GBs is, therefore, more likely to be “diverse” than “flat”. Linked to this, the diverse landscape’s “political” dimension is potentially more apparent than other landscapes of practice as, according to Young, expert knowledge is valued and lay knowledge is marginalized.

What a landscape of practice like a GB brings to the surface, therefore, are boundaries between different practices where individuals have a “lack of a shared history”, which means that these “boundaries are places of potential misunderstanding and confusion arising from different regimes of competences and commitments, values, repertoires, and perspectives” (Wenger-Trayner and Wenger-Trayner, 2014: 9). Wenger-Trayner and Wenger-Trayner’s (2014) key idea is that learning in the form of professional development occurs through “crossing boundaries”—an often uncomfortable maneuver that involves shifting away from the safety of a “flat” landscape. For Clark et al. (2017), in order for professional development to occur, it is the nature of the relationships between participants as they cross boundaries which needs articulating and exploring. When this occurs, boundaries between practices are not merely identified through difference but are crossed as learning takes place through a “hybridization” of practice (Clark et al., 2017: 245). Young’s research where “lay” knowledge is seen as marginalized by managerial knowledge suggests hybridization which involves lay knowledge could be difficult to achieve within GBs, especially as educational and managerial knowledge form their own exclusive hybrid practice within a wider neoliberal context.

With relation to IEBs who were participating remotely, while there is no literature relating directly to remote governance of schools, the concept of e-governing, where achieving governor responsibilities through “the use of IT” (Mundy and Musa, 2010: 148), is relevant. Here e-governing is defined as using IT to allow governors to attend meetings remotely rather than using IT to facilitate paperless meetings which governors attend in person. As indicated at the start of this article, the pandemic has forced the education sector to engage with online communication and in England in 2020 86% of GBs met remotely (NGA, 2020). What is of interest here is what can be learned from how technology was used by schools to support the e-governor IEBs to cross boundaries in the new and diverse landscape of a school GB.

Project design

All new IEBs recruited by LBG in the Yorkshire and Humber region were invited by LBG to be part of the evaluation. Eighteen volunteered, representing 23% of those recruited by LBG in this region at the start of the evaluation. As indicated earlier, the evaluation tracked IEB governors from the start of their journey to approximately 18 months into their tenure. The IEB governors fell into three distinct groups: nine school governors (FGs); five non executive directors (NEDs); and five governors who attended GBs remotely (e-govs). FGs were traditional in nature—part of an individual school's GB, they attended meetings in person and often held roles on other school committees. The NEDs were senior leaders within LBG, and their governance role was strategic across a number of schools at Multi Academy Trust (MAT) level. E-govs were appointed to schools that struggle to recruit governors, largely due to their rural location, the idea being that they could participate in GB meetings remotely.

Each IEB governor was interviewed four times by phone over an 18-month period. The semi structured nature of the interviews provided the evaluation team with longitudinal and in-depth data on each LBG governor and their experience of being a new school governor. Each interview lasted approximately 30 min and the interviews were spread approximately 4 months apart. The interviews aimed to capture the IEB governors' experience of school governance at different stages and covered issues such as: the recruitment and induction process; training and support offered; and how well they settled into their role.

At the end of evaluation, key school stakeholders were also interviewed in order to provide their perspective on the development and impact of the IEB governors. These stakeholders included: School Executives (13); Chairs of Governors (14); School Business Managers (5); IEBs' line managers (4); and other key stakeholders (4). Teachers and parents were not included in this process, although the value of including their perspectives in future research is recognized.

All interviews were audio recorded and fully transcribed. The evaluation process followed the University's ethics procedures, in line with the British Education Research Association (BERA) guidelines. All participants were given information and consent forms, informing them of their right to withdraw at any time and that all data would be anonymized. A potential problem of evaluation is bias, with participants and researchers wanting to provide a purely positive outlook on the project under evaluation. In order to reduce the potential for bias, each IEB governor was interviewed by the same researcher who was, therefore, able to build a sense of rapport and openness. Perceptions of the IEB governors were also triangulated with perceptions of key stakeholders in order to help verify any claims made.

Using NVivo, a thematic approach to analyzing the data across participants through coding was taken (Miles and Huberman, 2014). This involved breaking down the evaluation's key foci on recruitment, training and development into themes. For this article, the thematic coding was then further interrogated in relation to Young's (2017) heuristic of knowledge as either educational, managerial or lay. Using the idea of professional development on a GB as boundary crossing, the themes were also looked at across time to explore how IEB governors experienced the educational knowledge with which they were initially unfamiliar over an 18-month period. This involved thinking about how their claims to "lay" knowledge manifested itself, particularly in relation to their "authenticity" as governors with a genuine interest (Connolly et al., 2017: 9) in their schools.

As a result of this theoretical analysis, four key themes emerged, which are explored below:

- IEB governors acquiring educational knowledge through formal and informal training to cross boundaries;
- IEB governors embodying lay knowledge;
- E-govs' experiences of barriers to acquiring educational knowledge and embodying lay knowledge;
- The impact of the hybridization of IEBs' practices on GBs and the business sector.

IEB governors acquiring educational knowledge through formal and informal training to cross boundaries

Initially, the evaluation was set to run for one academic year. However, following our second round of interviews with IEB governors in the spring term, our analysis of the interview transcripts indicated that it was likely to take more than a year for IEBs to settle into their roles and participate more fully in the diverse landscape of practice of their GB. This was due to the initial "peripheral participation" (Lave and Wenger, 1991) of IEB governors as they realized their need to acquire educational knowledge. In light of this and in light of the aims of the evaluation, the funders agreed to extend the evaluation by one school term.

Some IEB governors had school-aged children but this tended to be the extent of their educational knowledge prior to becoming a school governor. All were aware of their lack of educational knowledge and some exhibited the "confusion" caused by a "lack of a shared history", which is symptomatic of going through a process of boundary crossing (Wenger-Trayner and Wenger-Trayner, 2014: 19). Most talked about the educational "jargon" which they had to learn in order to fully participate and understand governor business. Some also commented on the length of documents circulated prior to meetings.

While the educational discourse of the GB's landscape of practice initially served as a barrier to participation, on the whole, and in line with Young (2017), the IEB governors "valued" educational knowledge as expert knowledge and were quick to acquire, understand and use it. This meant that rather than being marginalized by the need to cross boundaries, all IEB governors began to make some kind of contribution to meetings from the outset. One FG, for example, was surprised by the speed with

which she began to participate: “At the first meeting I thought I’d probably just sit there, just listening because I’m not an extrovert person really. But I did actually make quite a few comments, suggestions and raise a few things, ask questions, queries about things.”

According to another FG’s Chair of Governors, the relative speed of participation in the GB meetings was because, “if he didn’t understand a particular piece of jargon, he certainly asked, ‘what does that mean?’ and ‘what’s the implication of that?’ Whereas some other people would just let it wash over them and hope to pick things up; but FG was keen to learn more quickly, which was good.” Indeed, not being afraid to ask questions or ask for clarification was seen by some school stakeholders as one of the key strengths of a governor primarily recruited for their business expertise as opposed to a lay governor.

An awareness of the need to acquire educational knowledge in order to participate was linked to the different kinds of governor training accessed by different IEB governors, which included local authority training, school training, and LBG training. Some IEB governors also valued filling in a reflective log. Initially, the log was part of the research team’s data collection tools, but as the majority of the IEB governors found they did not have time to fill them in, the logs were ultimately not used for this purpose. However, two IEB governors did continue using the logs as a “boundary object” (Clark et al., 2017), which helped them think about the nature of their participation in the new landscape. For one FG, the log helped her to place her development as a school governor acquiring educational knowledge in a landscape of practice: “it reminds you of the incremental steps that you’ve taken along the way because otherwise it’s very easy, 16 months on, to think well actually now you’re asking me, what did I do?”

By comparing the three governor types, some generalizations about the ways in which these different groups acquired educational knowledge and what this meant for their participation in the landscape of their GB were identified. The barriers experienced by e-govs are discussed below, but it was the NEDs who, as a result of the skill-sets acquired in their jobs as senior leaders, were least likely to access formal training and most likely to learn through professional conversations with key school stakeholders. One NED, for example, said, “I’ve not tapped into any training. I felt like I didn’t need it, I’ve done leadership days before, I’ve facilitated before, I’ve set strategies for teams and areas before”; and his CEO testified how this NED had “over-performed in terms of his uptake of complicated sector specific knowledge.”

IEB governors embodying lay knowledge

As well as the importance of acquiring educational knowledge, the interviews with the IEB governors emphasized the importance of personal relationships in terms of participating in the diverse landscape of the GB. Indeed, the building of these relationships with other GB members was evident with most IEB governors and was symptomatic of both the ideological values which had initially motivated their participation as well as the ways in which they endeavored to gain a contextual understanding of their school or schools. Taken together, these motivations and context-specific actions meant that IEB governors were developing “authenticity” associated with the stakeholder model (Connolly et al., 2017) through acquiring contextual, local knowledge, which is similar to Young’s lay knowledge (2017).

From a broad ideological standpoint, all IEB governors spoke about wanting to take on a governing role in order to “make a difference.” Often this was linked to pupil employability and how their organization could help ensure pupils had the right skills and understanding to enter the world of work, but more generally it was about volunteers working with a school which was part of, or close to, their communities in order to “give something back.” One FG, for example, proclaimed a “passion” for schools and a belief that education can change lives: “Education for me is one of those things that makes a big difference. So my family background, I am the first to go to university. That seriously changed the kind of work I do compared to what the rest of my family do ... I wish I’d become a governor years ago.”

For IEB governors, their purpose went beyond “compliance-checking” where education is viewed by professionals as an audit-able commodity (Wilkins, 2016; Young, 2017). Another FG, while acknowledging external measures of school competence were important, had a clear sense of the need to provide a holistic education bespoke to the pupils in the school: “It’s that constructive challenge to help the school move forward with its aims, one of which is of course to become outstanding. But also, I suppose on the softer side, retaining the character of the school while at the same time clearly ensuring that the right education is provided to sectors of the pupil population.”

For the majority of IEB governors, understanding the local community as well as the teachers was key in terms of ensuring their effective participation on their GB. This enabled IEB governors to understand and share the values of their schools, and in order to do this, most IEB governors visited classes, spoke to teachers and, in some instances where they were unfamiliar with the community, accompanied Community Officers on visits. The NED’s School Executive recounted: “He spent a morning in school and went out on home visits with our New to English Team who support Roma students who have very poor attendance records and he went out with them in the minibus and he watched them. In fact, he did a home visit with one of them and knocking a kid up who hasn’t got up and out to school but trying to get them in for the rest of day.”

Equally, there was an awareness and understanding of the importance of the GB in leading the school and how the IEB governors had an obligation to commit their time and energies to ensuring the school was successful. One FG, for example, was acutely aware of the history of her GB and what this meant for her participation: “One of the things they’re hoping to achieve, which I would like to support them with, is a little bit of stability within their GB as they have had a lot of change for the last couple of years and someone who is hopefully going to stick around.”

E-govs' experiences of barriers to acquiring educational knowledge and embodying lay knowledge

From the perspective of the e-govs themselves, there was a clear perception of barriers to them participating fully in the new and diverse landscape of a school GB. These barriers were apparent at each stage of the settling-in process, from initial training and induction to throughout the academic year. In relation to training, while all IEBs had access to the same range of online resources and training programs, in some instances there was an expectation placed by schools upon these IEBs to attend face-to-face induction training. For three of the e-govs, the travel time was impractical, with one commenting: "because of the distance that's involved it's physically impossible to attend those."

Training aside, all five e-govs and their schools experienced different degrees of problems with the technology designed to engage them in GB meetings. These were quickly resolved in the case of one e-gov, but the other four experienced ongoing technical problems that, in some cases, were never resolved. For one e-gov this barrier was so extreme as the school were never able to work any of the technology meaning that the e-gov had to correspond directly and only with the Chair outside of meetings. As the e-gov identified, this was in part down to the culture of the GB: "they just don't operate in that way, they work on a face-to-face basis—that you're in the room for the meetings." More than this, the school's physical environment was seen by the Chair as not accommodating the remote governance concept: "it's a very old school. The technology is about 30 years behind the times and we just really had problems in getting an audio contact with our e-gov during meetings."

The barriers in relation to induction, training and virtual attendance at GB meetings meant that these IEBs were less likely than other IEBs to acquire "educational" knowledge in order to take on specific roles on sub-committees within their schools. Indeed, while other FGs and NEDs had at least one specific role in addition to being on the main GB, this was the case for only two of the e-govs. The barriers to engagement experienced by the IEBs meant, as a whole, e-govs did not settle into their roles as quickly or effectively as the other IEBs.

For one e-gov the barriers to engagement became so great that by the end of her first year in post she felt that she had no other option but to resign. However, according to the School Executive, this Multi Academy Trust (MAT) made two similar appointments, who were not part of this evaluation but who took to their roles more effectively than this e-gov as they lived near enough their schools to make a visit and attend GB meetings in person. Accordingly, one of these IEBs was appointed as an advisor to the MAT's Audit and Finance committee; the other has physically attended most meetings and is now Chair of Governors at her allocated school. The School Executive explained: "She was able to physically attend meetings more. She came in through the remote governance program but she's able to be more than a remote governor but if we'd not engaged in the program we would not have ended up with her being a physical presence around our governing body table and now Chair."

What this emphasizes is the importance of embodying lay values and knowledge by forging relationships with other GB members. Given that GBs are together perhaps once or twice a term, this was even a challenge for those IEBs who did attend meetings, but when e-govs attended virtually with technological issues, barriers to building relationships become exacerbated. One Chair commented that this was a key issue which required further thought: "I think that one of the areas that [needs] addressing is how you build up the social side of things, which is important."

One e-gov ultimately felt so compelled to try to build a relationship with his GB that he undertook a 200-mile round trip in order to do so. He commented: "I understand the actual principles behind the project in the first place to try to reach these remote locations, but having that face-to-face contact, you know, the hand shake and the sitting down with governors, I think helps cement the relationship that much stronger." In line with this, where IEBs did settle into their roles more quickly, a key variable was the relative proximity between their homes and schools. For two e-govs, the distance from their homes to their schools was not prohibitive of them attending occasional GB meetings in person and undertaking school visits, and this meant that they both felt part of their respective GBs and acquired the "lay" knowledge relating to the specific context of their schools, its staff and pupils. As one of these e-govs commented, attending meetings in person at the start of their appointment helped her develop a working relationship with the rest of the GB and enabled her to then participate more fully in meetings by dialing in: "I'd been to a few of the meetings so I'd met them all face-to-face and they were a really good group of people. So being on the phone worked really well because I never felt like they'd forgotten that I was there and they kept me included as and when if anything was happening."

The impact of the hybridization of IEBs' practices on GBs and the business sector

Despite the barriers experienced by e-govs, the perspectives of IEB governors and their school stakeholders demonstrated that all IEB governors had ultimately been able to participate in the diverse landscape of their GB in order to make some kind of impact upon different aspects of the running of their school. This was because all IEB governors brought with them knowledge and skills from their business-based landscape of practice which were shared in order to help GBs run their schools as a business. This, in turn, impacted positively upon a range of aspects including: outcomes for pupils; the confidence, knowledge and skills of the GB; and school business practices. In relation to pupil outcomes, school stakeholders felt that their IEB governors had, on the whole, indirectly contributed to improving school performance and the educational outcomes of pupils. As one

Headteacher stated, this tended to be associated with ensuring the “financial and business state of the school is intact.” Indeed, all school stakeholders felt their IEB governors had increased the confidence, knowledge and skills of their GB as a result of the complementary skill-set they brought with them. In relation to school business practices, depending upon the existing knowledge of the GBs, some schools were in greater need than others of the IEB governors’ professional skill-sets. One Chair, who had a background in purely educational rather than managerial knowledge, spoke about how their e-gov had been able to “act as a mentor to me when I was starting to move things forward with the Headteacher.” This meant that the IEB governor was informally employing mentoring techniques to develop the Chair’s managerial knowledge in the specific context of the school’s finances.

However, as indicated above, the impact of IEB governors upon their GBs and schools was by no means immediate and tended to become more apparent to the research team at the fourth and final interview. What this demonstrates is that the application of the IEB governor’s existing skill-set to a GB was contingent upon them crossing boundaries to acquire educational knowledge rather than tenuously laying “claim” to educational knowledge (Young, 2017). Perhaps more fundamentally, this acquiring of educational knowledge seemed to go hand in hand with the IEB governors holding idealistic views about the purpose of education for all children in relation to their own participation in their GB. This meant that the acquiring of educational knowledge was inextricable from the acquiring of lay knowledge for IEB governors—a stark counterpoint to earlier research which held managerial knowledge as a direct threat to lay knowledge (Young, 2017).

That being said, even once some IEB governors had acquired new knowledge, on occasion they found it hard to bring their business practices into the landscape of the GB. Often these difficulties related to the ways in which the GB meetings were run, with IEB governors expecting short, outcome-driven meetings. One FG, for example, had recommended to his GB that they streamline their documentation prior to meetings and adopt a more corporate approach within meetings: “What I found is from the governance meeting is that they just have stuff to talk about and it’s not actually clear whether a decision needs to be made or not. I have raised [it] at the last governor meeting and ... I think they were more comfortable with how it’s currently set out.” As discussed above, these operational barriers were even more acutely experienced by e-governors who experienced insurmountable technological problems.

This indicates that the managerial knowledge of IEB governors, even when transformed by the acquisition of educational and lay knowledge, was at times subject to being marginalized within the GB. In contrast to Young, therefore, what our study shows is that managerial knowledge was not only tentative in developing agency in GB meetings but that managerial knowledge also appreciated the need to be transformed and hybridized by educational and lay knowledge—a process which meant that managerial knowledge itself was sometimes marginalized by what had become the “flat, common-sense” practices of the GBs (Wenger-Trayner and Wenger-Trayner, 2014).

What is also evident is that the acquisition of new knowledge in order to participate in GBs resulted in the transformation of practice for IEB governors in different ways. These new hybrid practices, which resulted from crossing boundaries (Clark et al., 2017), were not simply enacted in GBs but were transforming in relation to the workplace. Indeed, most IEB governors reported that their governance role had positively impacted on their professional work and benefitted them in terms of their continuing professional development. The professional benefit most commonly cited by IEB governors and their line managers was not the acquiring of new skills per se, but rather a growth in their “self-confidence” which enabled them to carry out their professional role more effectively. This was explicitly linked to a “broadening of horizons”, “working in a new environment” and “working with people from different backgrounds, cultures and communities”. As one e-gov commented, “I think because I’ve gone into something that I’ve not done before, it’s given me more confidence because I’ve taken the skills that I’ve got in my current role, from a finance background, to use them in another environment and with people that I didn’t know and who didn’t know me. And I feel like they appreciated my input and appreciate the support they got from us, so it’s just given me a bit more confidence in my role.”

In line with the theoretical framework of this article, the confidence gained by IEB governors is seen as arising from the changes undertaken through acquiring the knowledge to participate effectively and with agency in a landscape other than their usual workplace. As one FG’s line manager stated, gaining confidence seemed to have a more profound effect upon his participation in the businesses landscape of practice: “I feel that he’s now got that drive and passion within him. It will end up seeping through into his work. I feel that it has had a positive impact on giving him that purpose that he has been looking for. That spark.”

Conclusions

By capturing the perspectives of new business governors as they settled into their roles as well as the perspectives of key school stakeholders on this process, this article provides an insight into the ways in which IEB governors cross boundaries in the acquisition of educational and lay knowledge to transform their practices within the diverse landscape of practice of a GB. In contrast to earlier research, which tends to see the business community as a threat to both the stakeholder model (Connolly et al., 2017; Wilkins, 2016) and lay knowledge (Young, 2017), our longitudinal study captures some of the complexities of practices in GBs involving new business governors.

Seen from this longitudinal perspective, we arrive at a new conceptual understanding of the participation of managerial knowledge in school GBs. Rather than participating through exerting power which claims educational knowledge and co-opts and marginalizes lay knowledge (Young, 2017), managerial knowledge is often tentative in its initial participation in this diverse landscape. Furthermore, managerial knowledge's tentative participation is symptomatic of an awareness of the need to acquire rather than lay claim to both educational and lay knowledge in order to be able to contextualize skills and practices. More fundamentally, managerial knowledge seems to be underpinned by a value set which is altruistic and authentic and which has otherwise been seen as only belonging to lay governors within a stakeholder model (Connolly et al., 2017). This tentative participation, involving those with managerial knowledge seeking to acquire both expert and lay knowledge, means that while becoming more diverse, the GB becomes less hierarchical as a landscape of practice (Wenger-Trayner and Wenger-Trayner, 2014), which in turn facilitates boundary crossing and the transformation of practice through "hybridization" (Clark et al., 2017). This suggests that Connolly's (2017) argument about the lack of "authenticity" of a GB with members from the business sector does not always hold true.

Given the global context of neoliberalism and the global trend toward the decentralization of school governance, the implications of this new conceptual understanding of the role of the business sector in the running of school GBs are manifold. In relation to England, where recruitment of skilled governors is difficult (NGA, 2020) and where this is especially the case in areas of economic disadvantage (James et al., 2013), operationalizing these implications will help address governor shortages and, albeit indirectly, improve outcomes for children.

Firstly, this case study indicates how that other businesses should follow suit as part of their civic duty. This would include businesses allowing their staff time to undertake school governance. The resulting hybridization of practice, we have shown, is likely to have benefits for schools and businesses alike, especially within the wider context of performativity. Secondly, given the various ways in which different IEB governors acquired educational knowledge, an understanding of the bespoke nature of professional development is needed by those who provide induction and training (local authorities, private companies, schools). This includes allowing for development to be bespoke and informal as appropriate, with an emphasis also upon providing high quality online training for IEBs operating remotely. Thirdly, in relation to the barriers to participation experienced by e-govs and given the way that the pandemic has since forced school GBs to change their cultures and practices, IEB governors operating remotely could in this current context offer a more significant contribution to recruitment issues faced by GBs in both disadvantaged and remote areas. This could be especially impactful were GBs to think about ways of building relationships with remote IEBs in order to overcome social barriers that have been apparent in this study. And finally, further research needs to be undertaken by the academic community and shared with school leaders in order to understand the ways in which different GB members utilize their knowledge sets and interact with other members. This could involve researchers working alongside or within GB meetings in order to develop a deep understanding of the nature of different stakeholder participations in a diverse landscape of practice.

Introducing leadership

Leadership has a long history as a theme in management studies and, more recently, trumping management as a more preferred term and permeating educational landscape and research. As a concept, leadership has been riddled with controversies since its inception. The first controversy concerns the lack of agreement on what leadership means. Stogdill (1974) had earlier argued that “there are as many definitions of leadership as those who have tried to define it” (p. 1). Carroll and Levy (2010) have labeled leadership a “mysterious and complex concept” (p. 212), with others, including Billsberry (2009: 3) and Iwowo (2015: 114) contending that leadership is “in the eye of the beholder”. This social constructivist perspective suggests the significance of defining the contextual use of the term leadership. As Iwowo perceives, the lack of conceptual clarity surrounding leadership presents a dilemma for leadership development as it is difficult to develop people for something that is not known. Equally, identifying effective leadership practices becomes well-nigh impossible if the nature of what is being sought is not known.

In western conception, originally, leadership research focused on the “who” of leadership, seeking to distil the personality traits that separated leaders from non-leaders. These early models of leadership were influenced by the notion that [great] leaders possessed particular traits, and were based on research conducted in business, military and government settings, and the White men who led these institutions (Middlehurst, 2008). Trait leadership theory thus, suppressed and neutralized “difference”, including considerations of how gender and race/ethnic dimensions may impact leadership (Parker, 2005). Leadership stereotypes tended to be linked to whiteness, maleness, heterosexuality, and middle-class attributes (Coleman, 2012). Although leadership research has moved away from trait approaches and into more behavioristic and situational approaches, these criticisms remain true of much contemporary leadership theory.

Secondly, leadership theorizing has generally shifted from individual to relational dimensions. Fletcher (2003) argued that modern conceptions of leadership are “post heroic” and rely on a network of interdependencies at different levels within organizations. Approaches such as distributed leadership (Lumby, 2013) and transformational leadership (Dvir et al., 2002), emphasize the significance of leaders’ engagement and leaders’ impact on followers. Despite this shift, researchers have tended to minimize how such relationships may be influenced by social identity and status inequality. Leadership scholars (e.g., Ayman and Korabik, 2010; Chin, 2010) have argued for closer integration between leadership research and diversity, challenging assumptions that conception of leadership is gender, race and culture neutral. Ayman and Korabik (2010) argued that in actuality, “gender and culture affect leaders’ style, behavior, emergence and effectiveness in many complex ways’ (p. 166).

The third controversy is that the phenomenon of leadership has traditionally been associated with the conception of formality of hierarchical structures and positional power within organizations as opposed to “informal and emergent leadership” (Middlehurst, 2008, p. 327). In this conception, leaders are typically those who get assigned to managerial roles, usually at the top of organizational structures. In educational institutions, such as schools, those at the top of organizational structures, who by default are regarded as leaders whether they do indeed provide organizational leadership or not, are school principals or head-teachers and those who follow them in the hierarchy. It is an expectation that those charged with the responsibility of headship will be leaders irrespective of whether they exhibit leadership qualities or not (Setlhodi, 2020). This hierarchical and top-down conception of leadership is increasingly problematic as it neither explains ineffective principalship nor does it explain the locus of influence that does not come from the top. This notion of hierarchical leadership is found unhelpful in contexts that are indigenously collaborative and interdependent, such as the majority of African societies, which, despite their own hierarchies, have traditionally sought to lead by

consensus (Iwowo, 2015; Setlhodi, 2020). Indeed, scholars have intimated the need to understand leader/follower relationships (Learnmonth and Morell, 2017) and the relationship between leader and the process of leading (Grint, 1997; Setlhodi, 2020) if we are to fully understand leadership as a social process of interaction.

In trying to understand this relationship, leadership scholars have viewed leadership in terms of a joint effort of “mutual influence” that is independent of any formal position of responsibility (De Rue and Ashford, 2010, p. 627). Furthermore, to understand the relationship between leader and leading, it is important to understand how those who end up with the badge of leadership develop this identity. Grint (1997) argued that leadership is a product of social influence that emerges overtime. Understanding the power dynamics in this social influence is central to understanding of gender inequity in traditional and contemporary notions of leadership and can equip us with skills to develop more relevant and responsive ways of developing leaders and bridging the gender inequality in leadership.

Leadership development

Leadership development is itself viewed as an essentially longitudinal process that happens over time (Day et al., 2009; Day, 2011; Lord and Hall, 2005; Miscenko and Day, 2016). From this lifespan perspective, leadership development is a process which begins in childhood and continues through adulthood, occurring through life experiences as leader identities are forged (Day et al., 2009). Moorosi and Grant (2018) illustrated this lifespan construction through the leadership socialization of African school leaders, suggesting a “relationship between early formations of leadership identity and a life-time commitment to providing leadership for schools and communities” (p. 655). While a distinction between leader development and leadership development has become necessary in interrogating processes that build organizational leadership versus individual leadership (Day, 2001; Dalakoura, 2010), there has also been an argument toward understanding these processes as complementary sides of a coin. In this regard, the most helpful distinction is that made by Day (2001) and Dalakoura (2010) that leader development focuses on human capital while leadership development builds social capital. Having made that distinction, the authors agree that both are necessary for leadership effectiveness within an organization. In fact, leader identity development or leader identity construction denotes the process by which one comes to know oneself and to be known as a leader, and central to that is the notion of leadership development. By definition, leader identity construction is an aspect of leadership development that entails an individual process of self-concept, which van Knippenberg et al. (2004) perceive to be a “mediator of the relationship between leadership and follower attitudes and behavior” (p. 829). This self-concept gets affirmed by the collective followership within the organization through the reciprocal process of claiming and granting (DeRue and Ashford, 2010). Indeed, DeRue and Ashford (2010) contend that the process of claiming and granting is a social construction of identities that make identities “inherently related” (p. 628). It is through this social construction process that leader identities can shift between group members from leader to follower and vice versa (DeRue and Ashford, 2010).

As a body of research, leadership identity research has involved differing terminology including identity work (Carroll and Levy, 2010; Petriglieri, 2011), identity formation (Skinner, 2014; Komives et al., 2005); and identity construction (De Rue and Ashford, 2010; Moorosi, 2014). Although we do not have scope to deal with these different aspects to the same degree, we contend in this chapter that all aspects of identity are important to understanding leadership and how it remains a contested terrain of power and inequality. Thus, we align our thinking with those who see leadership as a process that entails more than just inhabiting a role, but a process of influence and direction-giving wherein an individual should identify as a leader and be sanctioned as such by others (Grint, 1997; Miscenko and Day, 2016).

Although leadership identity is well-established as an area of study within broader leadership and management studies, it is not widely explored in school leadership, particularly with regard to women leaders, who are still in danger of internalizing male perceptions of leadership within their own identities, as the field has been developed using male-generated theories (Murakami and Torsen, 2017; Parker, 2005). These male conceptions of leadership have implications for leadership emergence, leadership effectiveness and leadership development as aspects of leadership identity development (Ibarra et al., 2014). Indeed, men and women have been found to experience different impediments to leader identity development (Ely et al., 2011). When women prioritize the male perceptions of leadership, they inadvertently suppress their own feminine identities and when one identity is suppressed, this can lead to identity conflict (Debebe and Reinert, 2014). Karelaia and Guillén (2014) have intimated that an “identity conflict” arises when women leaders perceive an “incongruity between being a leader and being a woman” (p. 204), or at the disjuncture between how others perceive an individual and how an individual perceives herself (Debebe and Reinert, 2014, 284). Debebe and Reinert add that, “identity conflict can activate a learning process that will take an individual through a path to constructing a personal identity” (p. 284). Indeed, social identity theories of leadership view gender and other social identities as central to the construction of leadership identity (van Knippenberg, 2011).

Women and leadership

The focus on the gendered perspective of leadership identity construction is necessitated by the traditional association of leadership with masculinity, that make it difficult for women to assert their presence in leadership despite breaking the glass-ceiling and dominating the workforce in schools and other educational institutions (Eagly and Karau, 2002). Eagly and Karau argued that leadership

holds prescriptive norms that render women less favorably evaluated than men in their leadership potential and actual leadership behavior. Ely et al. (2011) argued that subtle, institutionalized forms of gender bias—stemming from workplace structures, cultures, and patterns of interaction that inadvertently favor men—shape, and often interfere with, the identity work of women leaders. This leads to the scarcity of women in leadership despite a plethora of equal opportunity legislation across the globe, including some developing contexts (Mestry and Schmidt, 2012). In many regions across the globe, women have yet to attain leadership positions within their chosen professions in any comparable numbers to their male counterparts. Leader identity construction is thus fraught with difficulties as it is more challenging for women to find the most powerful mentors and sponsors. This is due to lack of role models for women identify with, gendered career paths that still favor men and gendered organizations that reflect men's lives and men's situations (Ely et al., 2011).

As a social group, women's experiences have not been used to develop current leadership theory and experiences of women of color continue to be underrepresented in the leadership discourse. Being white, male and middle class is much more of a guarantee of career advancement than possessing attributes which do not conform to the accepted cultural stereotype of what leadership looks like and how leadership is executed (Alston, 2012). Organizational cultures and practices ensure that the gatekeepers reproduce the status quo (Eagly and Carli, 2007), disadvantaging women who are as committed to their professional goals as men, and who "pour out of the top schools with great credentials and flood into the workforce" (Slaughter, 2015, p. 81) in abundance. Yet their decreasing visibility on the upper ranks of the career ladder is testament to the fact that women's participation in positions of power is still a phenomenon less ordinary, and even less ordinary for women of color (Alston, 2012). While the "what" of leadership, i.e., the complicated and multifaceted nature of leadership and recognition that being in a senior management role is a demanding and onerous responsibility, is widely accepted, and that those who take up the mantle of leadership forfeit much in terms of their personal lives, the "who" presents as a much more problematic issue, lacking agreement and acceptance of its representation in a multiplicity of jurisdictions.

Intersecting gender and ethnic identities

Ethnic and gender identities are both central to self-concept (Showunmi et al., 2015), yet in research they are often considered independently as the determining feature of individuals' experiences, isolated from other identity strands. Leadership studies on diversity often focus on single categories, limiting understanding of the complexity of individuals' experiences (Coleman, 2012). However, it can be argued that asking people to account for experiences based on one category (e.g., ethnicity) to the exclusion of another (e.g., gender) is an invalid conceptualization of reality when membership of both is confounded in individuals (Cole, 2009). Such "essentialism" categorizes individuals' cognitive processes, personalities and experiences in relation to single identity categories (such as gender) without considering how other factors (such as other identities, historical and current social context) influence these (Debebe and Reinert, 2014).

Intersectionality as a framework for understanding the interconnectedness of social identities disrupts the notion of essentialism in leadership research. Intersectionality is the "idea that social identities such as race, class, and gender interact to form qualitatively different meanings and experiences" (Warner, 2008, p. 454). The term is often attributed to Crenshaw (1991), who drew attention to African American women's invisibility resulting from their minority status in gender and race scholarship. Consequently, ethnic minority women became subsumed into categories that did not accurately reflect their perspectives and experiences. In the twenty years since Crenshaw's work, researchers have adopted the concept of intersectionality to examine how multiple identity dimensions such as sexual orientation, social class, and nationality influence women's leadership and work experiences across the globe (e.g., Hite, 2007; Pompper, 2007; Moorosi, 2014). Moorosi (2014) used intersectional analysis to show how women leaders' identity strengthened from a leadership development program. Intersectional perspectives integrate feminist and multiculturalist perspectives to understand women's experiences from a more nuanced perspective. They highlight how all identity categories depend on each other for meaning and significance (Richardson and Loubier, 2008; Debebe and Reinert, 2014).

Leadership identity construction: a gendered analysis

Leadership identity is defined as an individual's self-definition as a leader, based on a relatively stable set of meanings associated with being a leader. In simple terms, leadership identity means the extent to which one identifies and is identified as a leader. Shollen (2018) suggests that leader identity involves journeys that are related to what the leaders do as leaders and how they experience leadership and how they are identified by others as leaders. The processes by which leaders are identified and affirmed by others indicate reciprocation which entails leader identity development as necessarily a relational and social process that essentially involves other people (Ely et al., 2011; van Knippenberg et al., 2004). In this sense, leader identity is hardly an "individual pursuit" but one that actually needs a team of people, making it an ultimate "social-relational process" (Shollen, 2018, p. 162). DeRue and Ashford (2010) argue that the extent to which someone views themselves as a leader has three benefits: it enhances motivation to lead, it improves engagement in leadership processes, and it promotes the drive to actively seek leadership development opportunities (p. 628). Consequently, internalizing this leader identity becomes an essential ingredient for effective leadership. However, women leaders have been found to experience more challenges than men in developing leader identity, due to the bias inherent in social dynamics (Ely et al., 2011).

In a school context, this internalized leader identity would inform the school leaders' ability to lead their schools toward the achievement of set goals (Tubin, 2017). Tubin suggests that a leadership identity influences the clarity of the vision for the school, the extent to which the school principal sees themselves as a leader and the extent to which their authority is accepted by followers. This latter part is particularly important for women, as a significant body of literature shows women principals struggling to have their authority accepted by their subordinates (Davids, 2018; Moorosi, 2010; Shapira et al., 2011). This acceptance or lack thereof can affect women's self-efficacy and professional identity as leaders. Indeed, Shollen (2018) shows how building relationships within a team of people is particularly essential for women developing a leadership identity, as women represent a group that has traditionally not been viewed in leadership terms.

Scholars of leadership identity have established numerous ways of researching identities in leadership, many of which are hardly explored in educational leadership research. These researchers have also established that identity in leadership can be conceptualized at three different levels: personal, relational and collective identities (see, for example: Brewer and Gardner, 1996; Debebe and Reinert, 2014; DeRue and Ashford, 2010; Ibarra et al., 2014; Lord and Hall, 2005). Other scholars have focused on social identity theory and have brought to the debate the influence of social identities that people bring to leadership (Karelaia and Guillén, 2014; Showunmi et al., 2015; van Knippenberg et al., 2004). While these conceptions differ on their focus, they do overlap, demonstrating that identity can be thought of in multiple terms (Debebe and Reinert, 2014) and that these multiple terms vary depending on the subjects and their cultural orientation. The section below examines these different levels of identity development as constructed by DeRue and Ashford (2010) and others. An attempt is made to provide a gendered analysis of these levels within educational leadership.

Individual internalization (personal)

According to DeRue and Ashford (2010), the personal level of leader identity development involves individual internalization wherein personal attributes of a leader are reconciled with one's personal identity forming a persona that marks one's individual identity (Sethodi, 2020). Ely et al. (2011) found identity construction at this level to be a developmental process that indicates acquisition of some basic skills and a clear development of self-concept or "self-definition". This self-concept assumes that to be in a position to send the right messages about who they are, leaders must first understand themselves. Self-concept is inextricably gendered as women have not traditionally perceived themselves as leaders (Moller, 2003; Moorosi, 2020).

Indeed, as Lord and Hall (2005) earlier established, this self-understanding occurs before a certain level of expertise in leadership can be achieved. At this level, leader identity may change as people go through personal development experiences such as a leadership development program, as found by Richardson and Loubier (2008) and Moorosi (2014). Moorosi found that women leaders' identity developed as they went through a leadership development program, learning new skills and dispositions that gave them the confidence to lead. However, other studies established that, since personal attributes precede leadership development opportunities, they become central aspects on which leaders build on the process of knowing themselves (see, for example, Jacobson et al., 2007; Moller, 2003). In both studies, Jacobson et al. (2007) and Moller (2003) found that principals integrated their personal identities with being school principals, thereby enhancing their leadership identities.

Bennis (2009) asserted that knowing oneself means "separating who you are, and who you want to be, from what the world thinks you are and wants you to be" (p. 50). He perceives knowing oneself as a lifetime self-invention process that happens at different stages for different people. Day (2001) identified three capabilities (self-awareness, self-regulation and self-motivation) that he argued contribute to the enhancement of one's "individual knowledge, trust, and personal power" (p. 584). Self-awareness helps leaders to: (a) clarify their own values, strengths, and limitations; (b) recognize the influence of self on others; (c) be in tune with how others perceive them; and (d) understand the contextual factors that have shaped both self-concept and others' perceptions (Day, 2001; Hall, 2004). In a study with women leaders on a leadership development program, Moorosi (2014) found that the studied women leaders' "self-awareness, self-confidence and self-regulation" (p. 11) were more pronounced at the end of program which suggested that the leadership development program acted as a workspace for identity development, while others (e.g., Hall, 2004) have stated that leaders' self-confidence and personal authority grows as leaders progress in hierarchy and experience. Working with a different group of African women leaders, researchers found that women's self-confidence grew as they climbed the leadership ladder and as they occupied more than one principalship (Komiti and Moorosi, 2020; Moorosi, 2020).

Ibarra et al. (2014) assert that one way in which leader identity is internalized is by "developing a sense of purpose" or "taking a purposeful action", which would be affirmed or resisted by others. This they found to be an iterative process, which entails one's view of oneself as a leader being reciprocated by affirmations and confirmed by others' views, reactions and interactions. Indeed, women were found to "led by example" doing things that they want others to do (Moorosi, 2020). One such participant in Moorosi's study established that leading by example minimizes resistance and buys her reciprocation of her leadership. Affirmation or resistance to such initiatives become ways in which others communicate their views about one's fitness for leadership and can respectfully encourage or discourage subsequent assertions, which may affect one's sense of self as a leader. For example, resistance may diminish one's self-confidence, discouraging further attempts to take leaderful actions, which would ultimately affect how one is viewed as a potential leader (Ibarra et al., 2014; Moorosi, 2020). Thus, individual internalization is shaped by a variety of factors which include personal attributes, leadership development training and experiencing different leadership roles.

Relational recognition

The relational level of leader identity development suggests that, in addition to leader identity internalization, the leader's identity will be stronger if it is relationally recognized (DeRue and Ashford, 2010; Moorosi, 2014). This means that leadership is expressed through an interactive process of roles that are recognized and reciprocated by others. Indeed Moller (2003) affirmed that "through interactions and what the school principals tell they are doing, or not doing, they are making visible who they are or are becoming" (p. 23). Thus, as one's leadership is affirmed or disaffirmed by others within a particular context, leading to a more relational aspect of leadership identity construction (Ely et al., 2011), one's self-identity as a leader may be strengthened (DeRue and Ashford, 2010) encouraging one to seek further opportunities for leadership development. As Moller (2003) and later Shollen (2018) established, this affects men and women differently, given that traditionally people have held different perceptions about men and women as leaders.

DeRue and Ashford (2010) argued that the construction of leadership, and that of a leadership identity, are essentially about constructing a reciprocal relationship that must be affirmed by the parties concerned. Within the school leadership context, this would involve school principals and their staff working together and affirming each other through their relationship. Leithwood et al. (2008) reported that, when school principals' identities are sound, staff reported improved motivation and commitment, while staff in Jacobsen et al. (2007) study reported their contributions being acknowledged. Cunliffe and Eriksen (2011) argued that, in this relational process, organizations are understood as "communities of people and conversations" (p. 1431), to be engaged and related to. It is the "dialogical relationships with others—both in terms of how one is acknowledged or not acknowledged by others" (Davids, 2018, p. 171) within these organizations that shape identity. Fletcher (2003) has argued that relational forms of leadership, which include empathy, community and collaboration, are "post heroic" and associated with femininity and are often invisible and unrewarded. Indeed, the South African women principals in Davids (2018) study resorted to aggressive masculine styles of leadership to gain respect from colleagues. Moorosi (2020) also found that women were socialized in masculine ways. It is within this relational process of leader identity development that transformational leadership emerges from the interaction between leaders and followers (Yeager and Callahan, 2016). These post heroic theories of leadership are relational and foreground the interaction between leaders and followers but arguably, they ignore the inherent power issues that lead women to constructing their leader identities in masculine terms.

Collective endorsement

The third level is that of "collective endorsement" (DeRue and Ashford, 2010, p. 629), wherein one is seen as part of a larger social group. It is at the collective level that social identities such as gender, race/ethnicity and culture interact with the persona identified at the individual level, shaping and strengthening their leader identity. Karelaia and Guillén (2014) research demonstrates that women's positive social identities play a significant role in psychologically adjusting to the requirements of both personal and professional lives. In the school context, a school principal "has to gain the endorsement of the broader social environment as the leader of a particular school" (Tubin, 2017, p. 791). This involves being part of the broader social groups that shape social identity. In Lumby and Azaola (2014) study, women principals identified "mothering" as a contributor to their professional identities. A mothering identity in this context made women principals "belong" to a social group that offered more than just principalship.

DeRue and Ashford (2010) argue that collective endorsement may reinforce related identities, strengthening leader identity. In a study of both male and female principals in South Africa, Mpungose (2010) concluded that both male and female principals were inspired by role models whose involvement helped them in constructing their identities as school leaders. This literature suggests that individuals with a strong and integrated leader identity would be more motivated to engage in leader development and to exercise leadership than individuals not holding a leader identity, or those whose leader identity is less important to them. In another South African study, Davids (2018) found that women principals did not identify as leaders despite their success in leadership. Their sense of self-identity did not fit in with the norm of what principalship was in that context. Indeed, Ibarra et al. (2014) stated that leader identity should be more closely linked to career development particularly for women leaders. Women who view themselves as leaders may actually bring themselves to think like leaders and seek opportunities for leadership development, thereby strengthening their leader identity. Davids (2018) suggested that women leaders must be prepared to disrupt the situated frameworks of their leadership so that they are able to perceive and be perceived as leaders.

Toward inclusive leadership identity theories

What this presentation so far illustrates is that leadership and socio-demographic identities are closely entwined (Sanchez-Hucles and Davis, 2010), despite their limited attention in the literature, and particularly in the literature on women leaders in educational leadership. Leaders' social identities relative to their followers, influence their effectiveness and the extent to which they feel able to enact their leader identity. However, the extent to which this affects women leaders in various school contexts is questionable. In fact, most of the evidence from the literature suggests that women may not be able to bring their whole selves into leadership, arguably because of the dominant masculine cultures in which they work. Fletcher (2003) argues that the shift from self to "self-in-relation to" (p. 6) is useful as it is aligned with current notions of leadership. However, it is at same time complex as it is related to systemic gender dynamics in the workplace. van Knippenberg (2011) work suggests that prototypical leaders (typical or exemplary

representatives of a group) are liked more and have more positive relationships with subordinates and colleagues. This increases the likelihood that people will comply with requests, further reinforcing leader-follower relationships and strengthening the reciprocal claiming and granting process that strengthens leadership identity. However, such compliance is attributed to masculinity and not femininity. Van Knippenberg (2011) argued that the gendered group norms “render leader group prototypicality contingent on leader gender”, (p. 1081) which is more likely to be male because of male domination in organizational leadership.

The experience of many women leaders through the review of the literature suggests that women find themselves “disowning” their other identities because they just do not work to their advantage. Indeed, what has been labeled the feminine advantage to leadership, which makes women better transformational leaders for organizational effectiveness (Eagly and Karau, 2002; Fletcher, 2003), is in this sense not becoming an advantage for women. In this case, an assumed prototype of leadership is matched by men (and not women) and this is evident across many cultures in both western and non-western contexts (see Showunmi et al., 2015). Thus, the leadership perceptions that colleagues hold of minority group members may be weaker as they do not so easily fit into the mental representations held by people of these roles. For example, incongruence between female stereotypical attributes and the generally masculine environment at the top of many organizations may contribute to prevailing “glass ceiling” or “concrete ceiling” effects faced by women in the workplace (Eagly and Karau, 2002).

Showunmi et al. (2015) work illustrated to this notion of social identity focusing on gender, working with women in the western context. Their study sought to explore whether one’s own identity impacts the way in which women lead. They established that women hid their identity as they climbed the ladder to success, in order to fit into the organizations. They concluded that placing culture at the center of leadership development enables us to fully acknowledge what we bring to the table as leaders. Debebe and Reinert (2014) argued that the impact of not being able to bring one’s whole self into leadership gives a one-sided story of a leader’s identity and does not help develop leadership potential to its full capacity. Suppressing their [invisible] identities, which women were doing by not acknowledging who they are argue can happen consciously or subconsciously (Debebe and Reinert, 2014). Debebe and Reinert problematized the inability to bring one’s whole identity self as identity “miniaturization of self” (p. 290) that constrains leadership potential. Indeed, as the authors argued, “identity miniaturization poses a problem for effective leadership development as it constrains potential leadership qualities that do not fit with the miniaturized self” (p. 290). To further illustrate the occurrence of miniaturized identity, Lumby (2008) study of South African women found that women did not use gender as part of their collective identity. She concluded that this act of “disappearing gender” diminishes women’s ways of defining their leadership. In another study, Lumby and Azaola (2014) contended that “women taking up a school principal role may therefore face persistent and prescriptive stereotypes which mean, whether competent or not, nurturing or not, they will be transgressing one prescription or another, as woman or leader” (p. 16). Showunmi et al. study involved participants who identified as “women of color” in England; they were also found to “disappear” their culture and ethnicity because these identities did not fit in with the white masculine ways of leading within their organizations. Here, intersectionality is at play, revealing the disadvantage of multiple identities that are miniaturized.

Thus, this multidimensional approach to leader identity development helps reveal the shifting views of self from personal to collective, suggesting that identity work can be an iterative and co-constructed process that is fluid and non-linear (Ibarra et al., 2014). Sinclair (2011) suggests that identity work is active construction which involves leaders as “both authors of and objects in identity production” (p. 512), as leaders and followers are both involved [albeit to varying degrees] in identity work. Collinson (2006) found that followers are often a neglected “fantasy” in the process of identity construction. However, Sinclair (2011) asserts that central to identity work is the need to go back into backgrounds, histories and childhood, which is usually intended to help individuals begin to “unpack and work consciously with their beliefs, practices and assumptions about authority and leadership” (p. 512). It is indeed in the unpacking of women leaders’ stories that followers’ roles come to life, especially through the reciprocation of women’s leadership. Moorosi (2020) work reveals the significance of values in these childhood histories that the women leaders use to construct their leader identities. As a social and relational process of identity development, gender affects perceptions that people hold about women leaders and is a characteristic that is visibly noticeable and is thus central to leadership identity development (Moller, 2003; Shollen, 2018). Leadership is more typically associated with males, who are most often presumed to be competent leaders who are confident—women are more likely to question their ability to identify as a leader and may be less likely to be viewed by others as a leader (Shollen, 2018).

The literature on leadership identity development suggests that there are different experiences between men and women, which ultimately make the leadership development process a gendered career path (Ely et al., 2011; Moorosi, 2010, 2014). Given this difference, Boatwright and Egidio (2003) argued that women tend to view their leadership efficacy differently, necessitating an understanding of women’s leadership identity development processes. The question is how women leaders position this identity development and what identities are brought in. Debebe and Reinert (2014) reference to identity miniaturization becomes relevant in taking this work forward. Leading by example and acknowledging their values, women are showing signs of bringing their whole selves to leadership, which needs to be consciously encouraged as part of leadership development. The benefit of the latter would not only be on our ability to design effective leadership development programs, but also on the improvement of our ability to provide appropriate support for men and women, providing them opportunities to develop an identity of true self that exploits their full leadership potential.

The question of whether leadership identity development straddles at least three theoretical explanations of leadership behavior also remains and needs to be fully explored, as Brungardt (1996) suggested. To attempt an explanation, the personal level of identity development does seem to draw support from in the trait theory due to its emphasis on personal attributes of leaders. Here, there is an apparent interaction between the leaders’ personality as a precursor for how they internalize leadership identity. Behavioral

theories on the other hand explain leaders' relational ability, which is akin to group performance, while relationship theories such as transformational leadership emphasizes the "leader's role in the creation of culture" (Brungardt, 1996, p. 83). Indeed, this seems to present the integration of all three theoretical explanations as a good platform for leadership identity. Fletcher (2003) argued that the post heroic dilemma needs more scrutiny as to the extent of its benefit to women, which remains questionable. What implications does this hold for leadership development? Brungardt (1996) warned that leadership development should not be narrowly construed to imply only programs of training. He suggested that leadership development should include development activities throughout the lifetime of potential leaders, leadership education, and leadership training. The next section explores what this might mean in an educational context.

Implications for leadership development

The literature on leadership identity development programs (e.g., Komives et al., 2005; McKenzie, 2018) suggests that leadership identity is usually developed from those programs. Eagly and Karau (2002) suggest that because leadership is typically cognitively associated with male, women more likely question their ability to identify as a leader and may be less likely to be viewed by others as a leader. Recent studies show that when women have a more prominent and central leader identity, they are more likely to intentionally seek out opportunities to develop as leaders (Komiti and Moorosi, 2020). These women were active in networks and had informal mentoring relationships that supported their career development. This suggests that leadership development must be strategically placed within the career path and entail different activities.

In this sense, leadership development activities would be most effective if they enabled individuals to understand themselves within their contexts so that they are able to address issues that are unique to them and bring their whole identities, cultures and values into leadership. Ibarra et al. (2014) observed that when they plan for leadership development, most organizations tend to focus exclusively on the acquisition of new skills, which is not sufficient in and of itself. They argue that learning new leadership skills must be accompanied by a growing sense of one's identity as a leader. This, they argue, can be achieved by a greater understanding of second-generation bias, creating safe spaces for leadership identity development, where women can learn, experiment and create communities, and by encouraging women to anchor their leadership purpose—leading by example. Without these features, skills are developed within a vacuum, and, within a context that is less supportive of women as leaders and one that does not encourage others to recognize and accept women's efforts, women leaders are not likely to succeed as leaders in their leadership positions. Shah (2010) stated that,

people from diverse philosophical, ideological and faith backgrounds conceive and perceive educational leadership differently, particularly across the gender divide, drawing upon their beliefs, values and knowledge sources (p. 28).

Thus, as a multiple identity approach suggests, women can bring their holistic selves into the construction of identity in leadership. The women leaders can see their leadership in multiple identities shaped by their familial values, communities and socio-political contexts (Moorosi, 2020; Moorosi and Grant, 2018). They can bring mothering (Lumby and Azaola, 2014); role modeling (Moorosi et al., 2018), spirituality (Nkomo and Ngambi, 2009), religiosity (Shah, 2010) into leadership and leadership identity development. A successful approach to leadership development would thus be one that acknowledges the multiplicity of identities, values, cultures and roles. It is this expansive role of leadership identity development that needs to be considered in leadership development research so that it informs leadership understanding in context.

Conclusion

Through this conceptual analysis, we have argued that leadership is best understood as a social construction through which an identity of leadership is constantly negotiated. The analysis shows that the current understanding of leadership is influenced by hierarchical, masculine and relational notions, that despite the contemporary nature of relational leadership, leadership identity is a gendered space that so far does not appear to benefit women. The literature shows evidence of gender as a disappearing social identity and women leaders not enjoying the benefit of the feminine advantage. This calls for the expansive understanding of the context of leadership that might help facilitate the eradication of the masculine stereotypical image and identity of a leader.

Introduction

The concept of social justice (SJ) has a host of meanings, and therefore scholars and researchers tend to analyze different dimensions of leadership for SJ such as inclusion, caring relationships, moral engagement, and so forth (Oplatka, 2013; Furman, 2012). Yet, although there is no one dominant, holistic theory of SJ, it is widely accepted that this term refers to a society which values diversity by providing all people and groups with respect, dignity, fairness, basic rights, and opportunities (Arar, 2015; Flores et al., 2014).

In light of this epistemological nature of SJ concept, Lipman (2004) framed four imperatives that create a vision of SJ education: “(1). *Equity*: all children should have equal opportunities and rights, but special efforts must be made to overcome past injustice and inequalities of race, gender, and class; (2). *Agency*: education should allow students to take action to change their personal situations and social injustice ...; (3). *Cultural Relevance*: teachers should use students’ cultures to support academic success. They should work to develop sociopolitical consciousness and challenge unjust conditions; (4). *Critical Literacy*: schools should be a place in which students can examine knowledge and their own life experiences critically. The curriculum should be grounded in students’ experiences and challenge official knowledge that distorts the histories of marginalized groups (p. 17)”.

This vision is very similar to common conceptualizations of leadership for SJ that construct this model of leadership as action-oriented and transformative, committed and persistent, inclusive and democratic, relational and caring, reflective, and oriented toward a socially just pedagogy (Furman, 2012). In practice, according to Theocharis (2007, p. 222), leaders for SJ “advocate, lead, and keep at the center of their practice and vision issues of race, class, gender, disability, sexual orientation, and other historically and currently marginalizing conditions in the United States”. They also identify inequities in school policies, procedures, and practice and promote inclusive practice and equitable access to the curriculum. To this end, they assist teachers in planning curriculum and instruction, which is inclusive of students and families’ perspectives and experiences and challenge. They also modify staff’s negative conjectures and misperceptions about diverse students, families, and communities and thereby alter values (Guerra et al., 2013).

In their review of the scholarship about leadership for SJ, Nicholson et al. (2020, p. 96) indicated that this leadership focuses on the experiences of marginalized groups and inequality in schools. They sums up the major themes that appear in k-12 social justice leadership:

(a) the need for maintaining persistence, commitment and courage in one’s work ...; (b) building inclusive and participatory processes that engage students, families and educators and widen the voices contributing to decision-making in schools ...; (c) valuing caring relationships and continuously investing time and effort towards building and strengthening relationships ...; (d) engaging in ongoing critical self-reflection and personal work to gain clarity on one’s own perspectives, motives and biases and to expand and challenge them ...; and (e) continuously analyzing the evidence of student learning to determine where inequities exist that require immediate and responsive intervention

This comprehensive analysis of leadership for SJ provides us with the major concepts and practices leaders for SJ are characterized with in the literature and, consistent with Furman (2012), highlights the importance of this type of leadership in our neoliberal world. New leaders may need to develop the capacities required for individuals to engage in the complex, manifold tasks of leaders for SJ who strive to promote issues of social justice, equity, and equality in their school.

The aim of this article is to propose a research-informed analytical framework of the process through which new principals may undergo when constructing, explicitly and implicitly, an identity of leadership for SJ. Two points merit highlighting in the framework: (1) the emergence of awareness to SJ and the need to lead schools more ethically. (2) The factors affecting the formation of leadership identity for SJ in early career. After all, hierarchical status alone is insufficient to explain how and when the followers (or subordinate) perceive others as leaders (Marchiondo et al., 2015). Underlying my conjecture, then, is that new educational leaders for SJ should not only claim their role as “the leader” but also as the persons who led the school toward SJ.

According to the literature about early career in management outlined below, new leaders are likely to construct a leadership identity. There are several terms for this process of identity development in the literature, including: identity construction—the iterative and reciprocal process of identity shaping (DeRue and Ashford, 2010); identity formation—the product of interrelatedness between the context and the individual’s developmental and learning processes (Flum and Kaplan, 2012); and identity work—the process of engagement in forming, restoring, maintaining, strengthening or reversing the identity (Sveningsson and Alvesson, 2003). In broad terms, identity construction theory centers on the dynamics by which leadership emerges, as well as on leadership processes as they appear among all organizational members, rather than only among formal leaders (DeRue and Ashford, 2010). Accordingly, individuals have an active role in defining, redefining, and modifying their identities. In fact, they play an active role in molding the varied components of their identity, but certainly also in shaping social identity both in the subjective and supra-individual sense of the term (Postmes et al., 2005).

The formation of leadership identity is not limited to leadership development programs. Rather, it is formed and constructed during the first years in leadership positions. An understanding of the process of leadership formation and its factors during early career in a more holistic manner may help us better understand how leadership for SJ might be developed and molded. This in turn may not only enrich our knowledge of early career in educational leadership but also help design leadership preparation program contents that set the stage for the emergence of leadership for SJ in our schools.

Note, however, that in no way do I claim that every new principal is likely to construct an identity of leadership for SJ. It depends on many personal and organizational elements, some of them are discussed in this paper. In this sense, the current article presents an analytical framework of leadership identity building for SJ that some new principals may experience. In the next part, I analyze different aspects of leadership identity construction, in general, and of that of leaders for SJ, in particular.

Leadership identity formation for SJ

In early career, new educational leaders undergo distinctive career tasks and experiences (Oplatka, 2012). Thus, they may feel a “reality shock”, surprise, and a lack of full understanding of what an educational leader should do in practice. Their staff may be hostile toward them in the first several months after their arrival, and the new leaders are likely to face enthusiasm vs. stress, loneliness, professional insecurity and fear of failure. Likewise, they allocate most of their time to engage in technical rather than instructional work aspects, resulting in some sense of frustration and a lack of professional fulfillment. Above all, they are required to deal with multiple complex tasks and unanticipated negative events before acquiring sufficient practical managerial knowledge and skills.

Concurrently, new educational leaders face several unique career tasks as follows:

1. Mastering the basic skills and competencies needed to perform effectively and efficiently in principalship.
2. Developing an understanding of the school structure, culture and environment in order to stabilize one’s position in the school.
3. Becoming accepted as a competent educational leader whose staff and stakeholders trust his/her expertise and ability to run their schools.
4. Devising a new school vision with staff and constituencies leading to a new change program for the school.
5. Coping successfully with stress, frustration and negative emotions that accompany the establishment of a new role (Oplatka, 2012, p. 147).

The performance of these particular tasks in early career is intended to enable new leaders to establish themselves successfully in their role before moving into the next career stage and becoming experts in educational administration. One may see these tasks as part of the process of leadership identity formation in early career.

The importance of leadership identity building

It is widely accepted that an educational leader is not granted as a leader by school members and stakeholders only because s/he has been officially appointed to a leadership position in the school. In fact, the leader has to undergo a process of leadership identity formation in order to be accepted by school staff and by him/herself as a “leader” (DeRue and Ashford, 2010). In their leadership identity construction model, DeRue and Ashford (p. 631) suggest that “individuals ‘claim’ an identity and others affirm or ‘grant’ that identity as the underlying process by which leader and follower identity become socially constructed and form the basis of leader-follower relationship”. This claiming-granting process includes verbal/non-verbal and direct/indirect actions. For instance, a direct verbal act is making a statement that one is a leader (e.g., I am the principal here!), whereas an indirect verbal tactic is name-dropping with regard to knowing other notable leaders and having relationships with them (e.g., sitting in the principal’s higher chair, running the management meeting).

Based on this model, leadership can be defined as a process of mutual influence that change across time and situations as individuals claim and grant leader and follower roles. Leadership in organizations emerges, then, as a result of individuals claiming (for themselves) and granting (to others) leader identities, which we frame as a negotiated process of relational identity construction (Marchiondo et al., 2015, p. 903). Thus, when a teacher claim to be a leader for SJ in the school, s/he needs to negotiate with other teachers verbally and indirectly before they could affirm him/her as such a leader and follow his/her vision of SJ, honesty, and so on. For example, as part of the negotiation, the new leader might convince the teachers of his/her commitment to diversity, inclusion, and equality and in his/her capacity to promote justice in the school.

Through leadership claiming, then an emergent educational leader negotiates, explicitly or implicitly, a leadership role for him/herself (Kopelman, 2014). The emergent leader may claim this role by explicitly negotiating during a conversation—proclaiming that s/he will take the lead in a meeting or project about ethical consideration in staff meetings, for example. Another novice leader might instead rely on implicit negotiations, communicating indirectly to accomplish similar claiming, for example by sitting at the head of the table in a meeting with parents that handles issues of social injustice in the school (note, in many cases the head of the parent association could head the table).

Thus, claims serve to establish oneself as a leader within a particular group at a particular time (Marchiondo et al., 2015). For the purpose of this article, though, the emergent educational leader for SJ should not only claim his/her role as the leader but also as the person who leads the school toward SJ. For example, and consistent with McKenzie et al. (2006), it is not enough for the emergent leader to have developed a consciousness of SJ, equity, equality and the like, but rather s/he should encourage and support teachers in their attempts to develop it as well. Leading the staff toward SJ-oriented teaching strengthens the emergent leader's request to be acknowledged as a leader for SJ, at least in part because the teachers who consequently improved their skills to teach diverse students effectively may grant him/her as their leader.

More specifically, the act of granting a leader identity can precede a claim (e.g., “would you like to take the lead on this project?”) or may arise in response to another's claim (e.g., “yes, I agree that you should take the lead on this project”) (Marchiondo et al., 2015). However, claiming to be the leader is insufficient; the followers should accept the claims based on their perceptions of the “right” leader and their judgments of the ability of that person to be their leader. Note, followers' responses to another's leadership claiming and granting are important in molding leadership perceptions of both parties involved in the leadership identity construction process.

Based on Conger (1992) typology of leadership development, it is likely that granting a leader identity to the person who claims to be a leader for SJ depends, largely, on his/her ability to display skills and competencies that are expected from such a leader (e.g., the ability to run a reflective debate about the influence of the curriculum on unprivileged students). The granting aspect in this case is composed of many feedbacks that the emergent leader for SJ receive from school members and stakeholders who are committed to equity, equality, and just education. A support to the importance of feedbacks we gain from the next quote:

His self-perception of teacher leadership was reinforced by school administrators, who recognized his skills and gave him the responsibility to lead school science department activities. Feedback from his colleagues also made him realize that he had “good ideas” and could be a credible source of information whenever “they are introducing something new”.

Somnath and Hnuscin (2017, p. 362).

To further this issue, let us look at the components of equity consciousness as McKenzie et al. (2006) constructed:

By equity consciousness, we mean that teachers are aware of, accept, and act on four central beliefs: that all children—except only a very small percentage, that is, those with profound disabilities—are capable of high levels of academic success; that this academic success equitably includes all student groups, regardless of race, social class, gender, sexual orientation, learning differences, culture, language, religion, and so forth; that the adults in schools are primarily responsible for seeing that all children reach this success; and that traditional school practices result in inequity for individual students and groups of students and that these must be changed to ensure success for every child (p. 160).

Thus, teachers who have already developed SJ consciousness (and probably work in disadvantaged communities) might expect their new leader to develop such consciousness before they grant him/her as a leader for SJ.

Forms of leadership identity building

Yet, to be granted by the school members and stakeholders as an educational leader for SJ, the educational leader has to undergo a process of identity formation. From the career literature we learn that new managers' central concern is to become established in their new position, just as other employees (Hall, 2002). Indeed, they usually experience a kind of identity transformation as they learn how to think, feel and value as managers rather than as subordinates (Hill, 2003). This includes “taking charge,” i.e., the process of learning and taking action that a manager goes through until he or she has mastered a new assignment in sufficient depth to run the organization, and “taking hold,” i.e., developing an understanding of the new situation and an initial set of priorities and expectations with key subordinates as a basis for effective working relationships (Gabarro, 2007).

Hill (2003) work is especially insightful in illustrating the life of new managers in organizations. Briefly, she found that the transition to managerial positions is not constrained to acquiring competencies and building relationships, but chiefly includes a transition from specialist and doer who directly performs specific technical tasks done mostly by one's own efforts to a generalist and agenda-setter who initiate diverse tasks and get them done through others. During this identity construction new managers make the psychological adjustment required to make sense of their new responsibilities, learn what it means to be a manager, develop interpersonal judgment, gain self-knowledge, and cope with stress and intense emotions associated with their new position and the evolution of a new professional identity. Additionally, new managers in her study worked hard to build effective relationships with their subordinates and were eager to receive feedback from superiors and peers.

But, identity construction is slower moving and shaped by multiple roles taken in various settings (Carden and Callahan, 2007). "Leadership identity" is established when leadership is exhibited across both personal and professional contexts. When leadership identity is formed personally and professionally, it is easier to become comfortable as "leader" in an organizational role (Regan, 2016). For example, creating educational leadership roles seems to be an identity formation process for Emirati women. They are embedded in a multifaceted identity formation and maintenance dynamic which consists of being Muslim, being Emirati, being a woman, and achieving a managerial or leadership role organizationally (Samier, 2015).

Regan (2016) found that leadership identity formation in nonprofit human service organizations includes (a) encountering the possible clash in values between the person and the organizational setting, (b) renegotiating "belonging" with client, staff groups or executive teams that one may be leaving or joining, (c) becoming comfortable in an organizational role through the development of a "provisional self" in which power and authority can be comfortably exercised, and (d) exhibiting leadership behaviors across personal and professional roles (p. 448–449).

In light of Regan's components of identity formation, one may view the process of leadership identity formation for SJ as follows. Firstly, the new leader should balance between his/her values and those in the school and develop consciousness and passion for SJ. Secondly, to become comfortable with his/her ability to lead the schools toward SJ s/he has to develop a managerial self in which power and authority are legitimate and constitute an integral part of becoming a leader for SJ. Thirdly, to fulfill his/her passion for SJ, the new leader ought to be seen by staff and stakeholders as an expert in leading just education that promotes, among other things, equity, equality, respect, fairness, critical thinking, and honesty. Following Flores et al. (2014), I believe the new leader has to develop competencies such as building awareness of one's own biases, prejudice, and stereotypes, building awareness of how one internalizes notions of superiority and inferiority, developing the ability to appreciate other peoples' ways of thinking, and so on. In addition, the new leader for SJ has to acquire knowledge of social inequality, interpersonal and structural forms of oppression, and the impact of societal inequality on peoples' experience of privilege and oppression.

Finally, the new leader has to exhibit leadership behaviors across personal and professional roles that increase his/her image of leader for SJ and promote this issue in the school. For example, s/he has to develop skills to work with diversity and promote equity, engage in difficult dialogs, foster inclusion, and encourage the staff to participate in courses and workshops intended to help them promote SJ in their classroom. The question of what influences the identity construction of leaders for SJ is discussed in the next section.

The major factors of leadership identity formation for SJ

Now let us probe into five factors that may facilitate the emergence of leadership identity for SJ among new educational leaders. Some attention is also given to potential barriers to the emergence of leadership for SJ.

Pre-service and in-service training of principals

The seeds of SJ in the soul of the new leader may be planted in leadership development program that emphasize equity and social justice (prior to the entrance of the leader into his/her office). After all, training for future principals is fundamental to the development of leadership identity, as Cruz-Gonzalez et al. (2020) noted. In this sense, Pounder et al. (2002) indicated that leaders ought to be provided with new analytical skills, knowledge, and dispositions to promote SJ in schools. Therefore, they suggested including field-based inquiry focused on oppression and discrimination in leadership development programs. In addition, they recommended analyzing empirical data regarding racism in schools, examining stereotypes related to oppression, and developing socially just practices in the courses the consist this program. One may assume that these kinds of contents may increase prospective educational leaders' awareness of injustice and inculcate a desire (or even passion) to challenge unjust conditions in the school.

In other words, leadership preparation programs have to encourage future school leaders to think very differently about organizational structures and leadership roles, i.e., to develop a leadership identity that is oriented not only toward neoliberal policies but also toward issues of SJ. Thus, instead of adopting incremental reforms that simply add more layers to existing structures, the construction of leadership identity for SJ is influenced by programs that encourage prospective educational leaders to reconstruct roles and relationships at the school level around a vibrant core purpose focused on SJ and directed at improving student learning. But, according to Cambron-McCabe and McCarthy (2005), this cannot be accomplished without concentrating on teaching and learning. In their view, educational leaders have to possess high quality instructional skills and to be able to raise critical issues concerning equity, race, diversity, and privilege. When the prospective leaders enter their new school, well-equipped with skills and

competencies necessary to lead their school toward SJ, they are more likely to construct leadership identity for SJ. After all, without proper skills and competencies required to be considered by school members and environmental constituencies as an “effective leader”, it is unlikely that new leaders will be able to develop leadership identity effectively.

Mentors/role models

Every new leader needs some practical guidance and support to face successfully with the need to acquire new leadership competencies and skills.

Higgins and Kram (2001) identified developmental networks of mentors and defined them as “a set of people named by a protégé as taking an active interest and action to advance their career by providing developmental assistance”. Thus, when the mentor is also a leader for SJ, it is likely that the new leader will be able to form an identity of such a leader more effectively, because the mentor can help him/her in increasing awareness to SJ and implementing new policies and projects intended to face issues of race, class, gender, disability and so forth in the school.

However, when it comes to identity formation, role models can be seen as a network providing both near and active as well as distant and passive career guidance. Young women in Singh et al. (2006) study perceive senior women and men as remote role models, as well as closer role models such as managers and mentors. Likewise, role models are often considered to be key to the successful development of young aspiring managers. According to Shapiro et al. (1978), role models are individuals whose behaviors, styles and attributes are emulated by others. Note, role models are not familiar with the role model user, nor do they give their permission to be used in this way (Singh et al., 2006).

Role models may have strong impact about leadership identity construction for SJ. Thus, new leaders whose awareness of SJ is high (due to, for example, their principal preparation program) may use a selection of role models who have promoted SJ in their communities. Let's take for example leaders such as Martin Luther King or Maria Teresa. A new leader may be inspired by their life story to build appropriate leadership identities such as the articulation of messages that sharpen social injustice, the ways to harness the efforts of teachers in favor of disadvantaged communities, or the value of inclusion in the staffroom. It is important to note that the new leader has to learn how to lead the staff and convince stakeholders about his/her ability to be an educational leader. When great leaders for SJ constitute a source of inspiration, they “help” the new leader in forming a leadership identity that goes beyond the routine and the known. It is an identity that contrasts common and accepted neoliberal views of education and convince others to adopt and more social-emotional views of education.

Belonging to a professional group

Group belonging is the basis of leadership identity construction. Every group establishes standards and norms and if one excels at the norms and values created by that particular group, s/he acquired “rank” (power, authority, privilege) and is poised to take on leadership (Regan, 2016). Thus, a new educational leader who follows the dominant educational norms and values in the society and in the staffroom demonstrates his/her commitment to the school and, in turn, receive the legitimacy to be the leader. One should bear in mind that the leader is expected more than others to follow entrenched common norms and values and promote them in the group. When it comes to SJ, the new leader should become familiar with the dominant values as regard to justice, equity, equality and so on in the school and in the community and develop managerial strategies to promote them in the classrooms and the community. Furthermore, s/he should value diversity and encourage teachers to adopt socially just pedagogies.

Likewise, leadership identity is formed as a result of social interactions as much as based on personal abilities and traits. Individuals constantly strive to shape their personal identity in organizations, and are being shaped by discursive forces (Saarukka, 2014). Here again, the new leader's identity formation depends largely on those s/he is going to meet in the teacher's lounge, the parent association, the education district and the community. Leadership identity formation is strongly shaped by social interactions with other teachers and stakeholders. For example, if the interactions focus on social injustice and a lack of equal opportunities in the school, they are likely to mold leadership identity for SJ among the new leaders, and vice versa. If the staff ignores issues of SJ and “chooses” to center on the advantaged communities, the process of leadership identity formation for SJ will be slower and include many obstacles.

Education policy

Evidence supports the strong impact of educational policies on the construction of a professional identity in educational leadership (Cruz-Gonzalez et al., 2020). For example, accountability in a form of standards of performance, testing and student achievement as a measure of successful education, characterizing many western countries nowadays, may limit the new leader's autonomy and make it very difficult for him/her to construct leadership identity for SJ.

In contrast, when the policies encourage equity, equality, respect to diversity, and SJ and provide schools with adequate curricula and projects, it is more likely that new leaders will construct leadership identity for SJ. Knowing that their superiors (e.g., superintendents, supervisor, and school boards) support varied notions of SJ in education enhances new leaders' awareness of the importance of SJ in education. It may also drives teachers to perceive a new leader as a leader for SJ because they have been encouraged by the district/local education authority to engage in SJ issue prior to the arrival of the new leader.

This, in turn, assists the new leader develop interpersonal judgment as regard to SJ, gain self-knowledge about SJ procedures in the school, and cope with stress and intense emotions associated with his/her attempts to promote, for example, equal educational opportunities.

Personal characteristics

Leadership identity is very much affected by personal features. According to the principals' narratives, awareness of individual abilities was expressed and related to leadership issues (Saarukka, 2014). In the case of leadership for SJ, new leaders need to have personal features such as flexibility, sensitivity to others, high professional efficacy, respect to others and so on. These characteristics may facilitate their process of leadership identity formation, because they will be capable of being sensitive to disadvantaged students and believe they have the knowledge and skills to increase their achievements and well-being. As leaders, though, they need to believe they can inspire the staff and sweep them to follow the principles of SJ and identify inequalities in education. This belief is being developed a day after day in the process of leadership identity construction.

Likewise, new educational leaders who have experienced social injustice, poverty, inequality and so on in a certain period in their life may be aware of the need to promote SJ in education.

Barriers to leadership identity construction for SJ

From the factors discussed thus far we can conclude that leadership identity construction for SJ depends not only on the new leader's traits and experiences but also on contextual and environmental elements and constituencies. Theoharis (2007) identifies a number of barriers that can obviate SJ work in schools. These include the deficit thinking about marginalized groups that characterizes some schools, the preference of "technical" leadership over moral leadership in many educational systems, national and local policies that work against equality and SJ, and the burden to the individual of engaging in transformative leadership.

Based on Theoharis's analysis, leadership identity formation for SJ may be inhibited when school staff tend to marginalize the importance of equity, caring, and equality in the society or ignore the special needs of students from disadvantaged communities. Similarly, education districts or local education authorities that glorify high achievements and accountability over any other educational goals and needs may in turn decrease the significance of SJ in education. Thus, new leaders may interpret the educational policy as promoting high ranks and therefore concentrate most of their time on the improvement of teaching, learning, and external exams regardless of issues of class, ethnicity, equality and justice.

From the new leaders' perspectives, some may focus to a large extent on technical issues of leadership in their process of leadership identity construction over issues of moral education and SJ in education. This may be caused by their interpretation of current neoliberal ideologies of education as measurement-oriented, i.e., their performance is measured by technical standards rather than moral ones.

Conclusion

This article has attempted to address the issue of SJ leadership identity formation by proposing a research-informed analytical framework for the process and factors of this process and arguing that the central purpose of new leaders for SJ is to develop the capacities for leading teachers toward identifying unjust in the schooling process and promoting SJ. This framework captures the dynamic interplay between leadership identity construction and its personal and contextual factors in the school, and thus has the potential to clarify the process through which educational leaders become leaders for SJ.

New educational leaders need to play an active role in forming the central elements in their emergent leadership identity and in modifying their previous professional identity as teachers. More particularly, they may re-define the elements of SJ in their current identity to become not only advocates of SJ who face social injustice as teachers, but also leaders who led other to do it. Put another way, in the process of leadership identity formation the new leader becomes capable of making teachers aware of SJ and promote it in their classes.

To this end, it is important to emphasize issues of SJ and social injustice in leadership development programs and provide prospective educational leaders with skills required to lead the school toward SJ. But, we shall bear in mind that the practice of leadership for SJ (or the praxis) can be developed only after the new leader entered his/her role. The concept of identity construction sheds light on the process through which a teacher who has adopted critical, inclusive pedagogies and curricula becomes a leader who led others to do the same (and more than that). Practically speaking, the new educational leader needs to learn how to think, feel, and act as a leader rather than as teacher as well as to learn how to lead others particularly toward SJ in the school. This is not an easy task indeed.

While culture and society play a key role in our subjective conceptualizations of SJ (Oplatka and Arar, 2016), one should see the framework I proposed here as influenced mostly by the culture of Anglo-American nations. In no way do I claim for it to be universal, but encourage researchers from different societies to explore SJ leadership identity formation in their educational systems to fill the gap in our knowledge about leadership for SJ in developing countries.

Introduction

Principal leadership is the second most influential school-based factor that influence student performance after classroom instruction, accounting for one-quarter of all school effects on student achievement (Leithwood et al., 2004; Marzano et al., 2005; Robinson et al., 2008). Given the strong influence of principal leadership on school success, leadership stability is also a critical concern of well-run schools.

Principal turnover typically includes principals transferring to another school, becoming a superintendent or other district staff, becoming a teacher, retiring, or pursuing another career inside or outside of the education system (Farley-Ripple et al., 2012b; Parlow, 2007). According to the National Center for Education Statistics (NCES), in the United States, 18% of public school principals in 2015–16 didn't stay in the same position at the same school in 2016–17, including 6% moved to a position as principal at another school and 10% stopped working as a principal. Principal turnover rates are relatively higher in schools with high concentrations of low-income, low-performing students, and/or students of color (Béteille et al., 2012; DeAngelis and White, 2011).

Principal turnover could have negative or positive effects on school success, depending on turnover frequency, the quality of principals that leave or move, and whether the school has a collaborative school culture and distributed leadership structure (Hargreaves and Goodson, 2006; Mascall and Leithwood, 2010). Generally it takes at least 5 years for principals to change their identity from peripheral to insider so as to exert effective influence on school success (Hargreaves and Goodson, 2006; Mascall and Leithwood, 2010). That is, for principals to be known, trusted, and accepted by the staff, they need to become an "insider" who has an influential power in the school community of practice, rather than staying peripheral (Fink and Brayman, 2006; Hargreaves and Goodson, 2006). These insider principals are able to build trusting relationships with people that could support a reform and deal with some complex cultural issues, such as teachers' resistance to change; they are thus able to acculturate themselves into new environments (Mascall and Leithwood, 2010). Insider principals also exert strong influence on a school's community of practice and are able to sustain structural changes as well as attitudinal and social changes (Fink and Brayman, 2006).

From this perspective, frequent rotation or turnover of principals is harmful if it results in "revolving door syndrome," in which teachers perceive that their principals come and go frequently as if through revolving doors (Fink and Brayman, 2006; Mascall and Leithwood, 2010). Teachers may stop investing in change efforts and making progress in learning and instruction and "wait principals out" (Hargreaves and Goodson, 2006), and may become more cynical and resistant to change and less-committed, thus resulting in a lack of sustainability and development for teacher and student learning, and the interruption of trusting working relationships between principals and teachers (Macmillan, 2000). Empirical research suggested that frequent principal turnover is often associated with lower teacher morale, higher teacher turnover, and a decline in student achievement gains (Béteille et al., 2012; Copland, 2003; Farley-Ripple et al., 2012a; Fink and Brayman, 2006; Leithwood et al., 2004; Miller, 2013).

Moreover, turbulent change in school leadership can be highly disruptive to long-term school development and school culture (Béteille et al., 2012; Fink and Brayman, 2006; Gates et al., 2006; MacMillan, 2000). Frequent principal turnover may interrupt the implementation or even the termination of long-term instructional programs, thus causing loss of institutional memory, inconsistency of instructional goals and reform agenda, as well as a loss of educational resources (Béteille et al., 2012; Ni et al., 2015).

From an economic perspective, a great deal of human and financial resources are lost if principals leave the education system within a short time or are frequently transferred or rotated without necessary causes (Mascall and Leithwood, 2010). According to a national report conducted by the School Leaders Network in 2014 (School Leaders Network, 2014), conservative estimates of the cost to develop, hire, and transition each principal is \$75,000. Increasing principal retention rates in high-poverty schools to match those in affluent schools could save school districts in the United States \$163 million annually (Sable et al., 2010).

Principal turnover could have a positive impact on school management under certain conditions. For instance, principal turnover could be beneficial to school management and student performance depending on the effectiveness of a principal that leaves and the successor who comes in (Hallinger and Heck, 1998; Leithwood et al., 2004). Therefore, losing a high-quality and effective principal could be detrimental to a school, but it could be beneficial for a school when an ineffective principal leaves and a more effective principal takes over (DeAngelis and White, 2011; Gates et al., 2006). Furthermore, a certain amount of principal turnover could be beneficial to schools if it results in better matches between principals and schools, infuses innovative and productive policies into schools, and dismisses ineffective employees from the school (Abelson and Baysinger, 1984; Baker et al., 2010; Fullan, 1993).

Theoretical framework

Microeconomic Labor Market Theory

Principal labor markets have the common characteristics of the broader labor markets. Based on Microeconomic Labor Market Theory, principal labor markets can be comprised of three dimensions: the supply side, demand side, and policy environments. The supply side of the principal labor market includes principals and principal candidates. They have their own preferences and benefits regarding their entry into, mobility in, and exit from the principalship. The demand side of the principal labor market includes schools and district central offices. Schools need principals to lead, manage, and maintain the functioning of the school system. District central offices define the roles and responsibilities of principals in school management, create principal working conditions, as well as determine the hiring, rotation, and dismissal of principals (Ornstein et al., 2016).

School districts, also serving as state policy extensions, assume major responsibilities for setting school policies and ensuring that local schools are properly managed and meet requirements and regulations from the federal and state governments to enhance student achievement (Ornstein et al., 2016). In addition to school districts, the federal and state governments as policy makers can influence the principal labor markets through establishing and enacting statutes to raise student academic performance, overseeing policy implementation, administering grant funds, determining school taxes and financial aid to local school districts, engaging in educational innovation and research, and setting minimum standards for training and recruiting personnel, as well as providing curriculum guidelines and assessment requirements (Ornstein et al., 2016).

In summary, policy makers at the federal and state levels as well as local school districts create policy environments for principals to work in, which influence both the supply and demand sides and determine the equilibrium of the principal labor markets. During the past three decades, through the widespread introduction of accountability policies, state governments, local school boards, superintendents, principals, and teachers all have been assuming growing responsibilities and pressures to enhance student academic performance. These accountability policies exert a great deal of influence on principal labor markets. For instance, on the demand side of the principal labor markets, in order to meet student academic standards mandated by the state governments, school districts aim at searching for higher-quality principals. They often raise hiring standards and qualifications such as requiring a license/certification in administration, advanced education levels, and more working experience from principals, thus influencing the supply side of the labor markets, as well (Loeb et al., 2010; Whitaker and Vogel, 2005). Meanwhile, given pressures from state accountability policies, on the supply side of the principal labor markets, principals and principal candidates may want to work at schools with a higher proportion of high-performing students and supportive parents that could result in less pressures to achieve state academic standards (Farley-Ripple et al., 2012a).

Job Choice Theory

In addition to labor market theory, Job Choice Theory can be used to interpret principals' career decisions. Job Choice Theory, first introduced to the educational field by Young et al. (1989), can provide objective and subjective perspectives to help understand the career choices made by principals and principal candidates. Both personal and external factors are often weighed based on their relative importance to each individual as they make their career decisions (Behling et al., 1968).

From the objective perspective of Job Choice Theory, principals are "economic beings" who seek to maximize their economic status by joining the organization that is most economically competitive for them. Economic benefits such as salary/benefit packages and prospects for job advancement are all important factors in principals' career choices (Pounder and Merrill, 2001). Empirically, researchers have found that principals' salaries and other job benefits such as stipends and retirement benefits, are important factors in both drawing teachers into leadership and in retaining principals (Akiba and Reichardt, 2004; Fraser and Brock, 2006; Pounder and Merrill, 2001). For example, Fraser and Brock (2006) conducted a qualitative study on principal retention among Catholic school principals in New South Wales and Australia and found that financial security is a critical factor for principal retention.

From the subjective perspective of Job Choice Theory, principals are "psychological beings" who choose jobs to meet their psychological needs and emotional expectations (Young et al., 1989). Principals seek principalships in specific districts, schools, and community environments that are more satisfying and compatible with their own psychological needs (Behling et al., 1968; Pounder and Merrill, 2001). For instance, if a principal prefers to work in a democratic-leadership rather than a bureaucratic-leadership environment, then he is more likely to work in a district or school with this kind of organizational climate (Pounder and Young, 1996). As another example, principals often need adequate autonomy and time to work with their school communities

to achieve meaningful school improvement goals and to cultivate a positive school culture (Fink and Brayman, 2006). A lack of authority on school decision making could undermine principal job satisfaction, which could cause a principal to transfer to another school/district or even leave the education system (Vroom, 1964).

It is worth noting that, as an independent human being, a principal's individual preferences rather than school district assignments often play a more important role in his principal turnover decisions (Loeb et al., 2010). Although, in cases such as emergencies or reassignments within region or district offices, a principal could be directly appointed to a position without a formal selection process. More often, interested principals apply for and are then chosen for the open positions (Loeb et al., 2010).

Factors influencing principal turnover

With the guidance of the Microeconomic Labor Market Theory and Job Choice Theory, the following paragraphs review literature on factors that influence principal turnover, which can be categorized into principal characteristics, school context, and working conditions.

Principal characteristics

As the supply side of the principal labor market, principals' individual characteristics can influence principal turnover, since their characteristics are interactively associated with their objective/subjective perspectives regarding values and benefits of their job choice and transition (Baker et al., 2010; Fuller et al., 2007). Principal demographic and professional characteristics that are associated with principal turnover include principals' age (Fuller et al., 2007; Fuller and Young, 2009), gender (Akiba and Reichardt, 2004), race (Akiba and Reichardt, 2004; Baker et al., 2010; Chapman and International Institute for Educational Planning, 2005; Fuller et al., 2007; Gates et al., 2006), as well as professional experience, including years of administrative and teaching experience (Gates et al., 2006; Papa, 2007), and educational level (Gates et al., 2006).

Research findings regarding principal demographics have shown few consistent results. In terms of principals' age, Fuller and Young (2009) examined the tenure and retention rates of newly hired principals in Texas public schools from 1996 through 2008. Their findings suggested that newly hired principals between 40 and 44 years old have the longest tenure, and principals who are under 30 years old have the shortest tenure. Additionally, principals between the ages of 35 and 49 tend to have greater school retention than principals of other ages, especially for middle and high school principals. Examining interactions with race and gender, Akiba and Reichardt (2004) performed logistic regressions and concluded that, in Colorado, female administrators and administrators of color (both principals and assistant principals), younger than 40 or older than 56, had statistically significant higher attrition rates than male and nonminority groups.

Further categorizing different facets of principal turnover, Gates et al. (2006) performed multinomial logit regression on administrative data from Illinois and North Carolina from the years 1987–2001, and found that women are more likely to leave the education system and change positions than male principals. In contrast to the above findings, Baker et al. (2010) found that minority or male principals were more likely to be unstable in their positions. The inconsistent findings across the studies could result from varied principal individual preferences and from different methodology and datasets utilized in these studies. For example, Baker et al. (2010) categorized different types of principal turnover (in Missouri) and created different indicators of the time period at which a cohort member: (a) left the principalship altogether, (b) made a first move to another school, or (c) made a second move to another school. They then constructed a "stability" ratio to identify the amount of time a principal spent in any given school as a percentage of the total time that principal was in the dataset, and utilized truncated regression models and Cox Proportional Hazard models.

The professional characteristics that influence principal turnover include principals' education level, working experience, and whether having attended preservice professional training programs. In terms of education level, Gates et al. (2006) found that principals who had a Master's degree or higher were less likely to change positions within the state system than those without an advanced degree, but educational level had no significant effect on the probability of leaving the school system or transferring schools. They also applied Barron's ranking of the undergraduate college that a principal graduated from as a proxy for unobserved principal quality, but revealed no statistically significant relationship between principal quality and principal turnover.

For principals' years of experience, Gates et al. (2006) found negative coefficients on both linear and quadratic terms in regression for principals' years of experience, which indicated that very experienced and very inexperienced principals are least likely to change schools or positions. Similarly, Baker et al. (2010) found that more experienced principals were more likely to stay in one place and have higher stability ratios. However, they also indicated the possibility that ineffective but experienced principals were staying in their positions, which could reduce the reliability of using principals' years of experience as a signal of principal quality.

Additionally, principals' preservice professional training programs could influence principal turnover. These programs are mostly facilitated by universities that provide course work to aspiring principals in curriculum leadership, assessment, as well as school improvement and management (Grissom and Harrington, 2010). McKibben (2013) examined the influence of principal preservice training programs on principal turnover, but found no significant influence of district-level preservice training programs on the probability of principals moving to another school or leaving the principal profession, based on multinomial logistic regression on SASS and PFS in 2008–2009. She speculated that gaining access to preservice training programs did not necessarily imply the value of these programs, and that the quality of training should also be considered.

School context

From the demand side of the principal labor markets, school contextual factors reflect the circumstances that principals are working under, thus influencing principals' mobility and attrition decisions. School contextual characteristics include the proportion of students of color and low-income students (Baker et al., 2010; Gates et al., 2006; Loeb et al., 2010), prior student performance (Akiba and Reichardt, 2004; DeAngelis and White, 2011; Loeb et al., 2010; Partlow, 2007), school size/enrollment (Akiba and Reichardt, 2004; Baker et al., 2010; Gates et al., 2003), school urbanicity (Gates et al., 2006; Papa et al., 2002), school level (Baker et al., 2010; Gates et al., 2006), school type (Ni et al., 2015), number of students per full-time equivalent teachers (DeAngelis and White, 2011), and percentage of students or teachers in the school who are racial/ethnic minority (Gates et al., 2006; Papa, 2007).

Compared with the findings of the influence of principal characteristics on principal turnover, the literature on the effects of school context on principal turnover has shown more consistent conclusions. Generally, schools with higher proportions of low-income, lower-performing students, students of color, and less-qualified teachers are associated with higher possibility of principal turnover (Akiba and Reichardt, 2004; Baker et al., 2010; Gates et al., 2006; Loeb et al., 2010; Papa, 2007; Partlow, 2007). The following paragraphs elaborate on these findings.

First, principals in schools with large concentrations of students of color often have higher principal turnover rates (Baker et al., 2010; Gates et al., 2006; Loeb et al., 2010). With administrative data from Illinois and North Carolina from 1987 to 2001, Gates et al. (2006) found that principals in schools with larger proportions of students of color are more likely to transfer or leave the principalship, but principals who are the same race as a plurality of students have higher career stability. Baker et al. (2010) found that a higher proportion of African American students in school was associated with higher principal turnover with truncated regression models and Cox Proportional Hazard models. By dividing schools into different quartile groups based on proportion of students of color, Loeb et al. (2010) found that the odds of principals leaving were 60% higher in schools in the top quartile of minority students than the bottom quartile, which corresponded to a 5%-point difference in the probability.

Additionally, a larger proportion of low-income students are often associated with higher probability of principal turnover. Loeb et al. (2010) found that the odds of principals leaving the principalship were about 30% higher in schools in the middle quartile of free or reduced-price lunch than those in the bottom quartile, which is possibly caused by many principals' preference to work in schools with a lower proportion of minority, low-income, and lower-performing students (Loeb et al., 2010).

Moreover, higher student performance in a school is often associated with lower probability of principal turnover. Due to the formal and informal state and district sanctions and accountability pressures placed on schools, many principals prefer to work in schools with a larger proportion of high-performing students (Loeb et al., 2010). Higher-performing students are more likely to achieve higher test scores that could meet the state academic standards, and more involvement from affluent parents and communities could bring in more support and resources, thus attracting many principals to work in these types of schools (DeAngelis and White, 2011). This hypothesis is not universally agreed upon: Akiba and Reichardt (2004) found that lower school achievement only predicted higher attrition among female leaders. Further, Partlow (2007) found student math test scores to be the only factor that significantly influences principal turnover among eight school contextual factors, including superintendent turnover rate, building enrollment, student attendance, student mobility, pupil-teacher ratio, teacher attendance. DeAngelis and White (2011) found that schools with lower average test scores or those that fail to make Adequate Yearly Progress (AYP) often have higher odds of principal transitions. Moreover, principals who moved across districts often moved to schools with lower percentages of low-income and lower-performing students, but those who moved within districts moved to schools with similar student demographic characteristics (DeAngelis and White, 2011). They speculated that principal mobility within districts in Illinois may be determined more by district needs and decisions than by principals' preferences.

School enrollment has shown mixed results on the influence of the probability of principal turnover. Specifically, principals who transferred to another school in the same city often moved to schools with smaller enrollments, which indicates principals' preferences for smaller schools (Papa et al., 2002). Consistent with these findings, Akiba and Reichardt (2004) found that larger schools were more likely to have higher rates of principal turnover than middle-size and small schools. They speculated that smaller schools provide leaders with more opportunities to build close relationships with faculty and students. On the contrary, Gates et al. (2006) found that principals in larger schools were less likely to transfer to another school or leave the principalship to pursue another position in the school system. Although larger schools tend to have more problems, the higher principal salary in these schools could compensate for the more complex tasks and higher pressures that they need to tackle to some extent (Gates et al., 2003).

For urbanicity, Gates et al. (2006) found that the probability of changing schools was higher for principals in urban areas of Chicago and North Carolina relative to principals in rural areas, although the magnitude of these differences were small. In terms of school type, Ni et al. (2015) found that principals in charter schools were much more likely to leave the education system (including retirement) compared with traditional public schools with a longitudinal dataset in Utah from 2004 to 2011.

School level is another school contextual factor that influences principal turnover. Gates et al. (2006) concluded that elementary school principals had the least principal turnover, while high school principals were nearly twice as likely to change positions compared with elementary school principals, and middle school principals were about 25% more likely to change positions than elementary school principals. Again, other studies have different results; for example, Baker et al. (2010) found that middle school principals had higher turnover than those in high schools. They speculated that many principals regard middle school principalship as a stepping stone to obtain high school principalship, partly because high school principals receive a salary premium compared with principals in elementary and middle schools.

Finally, in addition to student demographics, schools with lower percentages of highly qualified teachers, as defined by No Child Left Behind (NCLB),¹ have significantly higher odds of principals moving to schools outside of districts and leaving the education system altogether (DeAngelis and White, 2011; Papa, 2007). Since NCLB mandates a basic level of qualifications, including higher expectations and requirements for teachers of core subjects, principals are under more pressures to recruit and hire highly qualified teachers, and to help teachers meet professional standards and enhance student performance (DeAngelis and White, 2011).

Working conditions

According to the International Labor Organization, working conditions cover a broad range of topics and issues, from working time (hours of work, rest periods, and work schedules) and remuneration, to physical conditions and mental demands that exist in the workplace (International Labor Organization, 2015). Compared with principal characteristics and school contextual factors that influence principal turnover, there has been far less research on the influence of principal working conditions on turnover.

Principal working conditions is often conflated with school context in the field of principal turnover research. The major reason is that many principals prefer to work in schools with fewer low-income, low-performing students, and students of color; and these types of schools often have better working conditions, including more resources, fewer safety and disciplinary problems, more parental involvement, fewer teacher vacancies, and less teacher and student turnover (Loeb et al., 2010). For instance, Akiba and Reichardt (2004) constructed principal working conditions as school contexts, including poverty level, proportion of minority students, school size, school location, and student achievement level, as well as instructional and administrative expenditure per student. These studies are significant explorations of the impact of working conditions on principal turnover, however, the equating of principal working conditions and school context can cause some difficulties for researchers to distinguish between the effects of school context and working conditions on principal turnover. Loeb et al. (2010) was one of the first studies that responded to this issue in research. They separated the influences of student demographics and school climate on principal turnover. Their findings suggested that high principal turnover in schools with more low-income, minority, and low student achievement could be driven by undesirable working conditions rather than student demographics in the schools.

From the Job Choice Theory Perspective, working conditions reflect principals' economic and psychological needs as they are making career choices, thus affecting principal turnover behaviors. Principal working conditions include economic benefits and nonpecuniary working conditions. Economic benefits, including principal salary and job benefits such as stipends and retirement benefits, are important factors to draw teachers into leadership positions and for principals to remain in the principalship (Akiba and Reichardt, 2004; Fraser and Brock, 2006; Pounder and Merrill, 2001). Nonpecuniary working conditions include all the other factors that are not related to salary and financial benefits (e.g., workload, autonomy, and advancement opportunities), are also critical concerns for many principals upon entering into, transitioning, or leaving schools (Farley-Ripple et al., 2012a; Loeb et al., 2010; Pijanowski et al., 2009).

Economic benefits

Principals are "economic beings" who seek to maximize their economic status by joining the organization that is most economically competitive (Young et al., 1989). Therefore, salary and benefit packages are important factors in principals' career choices (Pounder and Merrill, 2001). On the one hand, principals' salaries and job benefits are competitive compared with those of teachers (Pounder and Merrill, 2001). For instance, the average base salary of a high school principal in a medium-sized district in Utah exceeded that of a teacher with the same degree and years of experience in the system by 24%–55% depending on administrative experience (Pounder and Merrill, 2001). Moreover, in Arkansas' largest high schools, the difference between a midcareer teacher with a master's degree and a principal was a 97.5% increase in annual salary, or \$46,640 more pay per year for the principal in 2006–2007. Although most principals are on 12-month contracts rather than 9-month contracts like most teachers, after adjusting contract day difference, principals still showed a 67% increase in daily pay over teachers with Master's degrees and 15 years' experience (Pijanowski and Brady, 2009). The gap between principal and teacher salaries could incentivize teachers to move to various leadership positions (Pounder and Merrill, 2001). The relative salaries, which reflect pecuniary advantages of school principalship over many other educator positions, are perceived by principals as the strongest objective factor of job desirability of the principalship, which explained 38% of total variance in rating of job attraction and intentions (Composite Job Desirability Index) (Pounder and Merrill, 2001).

On the other hand, many principals perceive the gap between teacher and principal salary to be too small to reflect the much greater responsibility that principals assume compared with teachers (Pounder and Merrill, 2001). Thus, unsatisfactory principal salaries could be one of the reasons why principals leave for other positions (Pounder and Merrill, 2001). In fact, the gap in the compensation between principals and teachers has narrowed to the point that it may engender a discouraging impact on principal candidates or current principals who are considering entering or remaining in the principalship (Pijanowski and Brandy, 2009). Furthermore, the compensation gap between principals in different locations also varies dramatically. For example, principals' salaries are much lower in smaller, poorer, and more rural districts (Pijanowski and Brady, 2009).

¹NCLB requires states to (1) measure the extent to which all students have highly qualified teachers, particularly minority and disadvantaged students, (2) adopt goals and plans to ensure all teachers are highly qualified and, (3) publicly report plans and progress in meeting teacher quality goals. <http://www2.ed.gov/nclb.html>.

Given the strong influence of salary on principals' job desirability and satisfaction, empirical evidence has indicated that higher principal salaries are often associated with lower principal turnover rates (Akiba and Reichardt, 2004; Baker et al., 2010; Papa et al., 2002; Papa, 2007; Pijanowski and Brandy, 2009; Yan, 2020). Akiba and Reichardt (2004) concluded that salary was significantly associated with principal turnover decisions, and principals were more likely to leave when they expected an increase in compensation if transferring to another school. Additionally, Papa (2007) found that schools paying one standard deviation below the mean salary were 9.5 times more likely to lose their principals compared to schools paying one standard deviation above the mean salary. Baker et al. (2010) compares principal's relative salary to their peers in the same labor market, and found that principals are able to leverage school-to-school moves for an average change in relative salary of about 5% (Baker et al., 2010). They regard principals' relative salary as the most "consistent and potential policy lever for principal retention" (p. 551). Further, Yan (2020) found that higher salary lowers the odds of principals moving to another school relative to staying, while holding principal characteristics and school context constant.

Nonpecuniary working conditions

With state and federal accountability systems placing increasing pressures on school-level leaders to improve student performance, principals assume expanding roles, challenges, and a growing workload from multiple stakeholders (Loeb et al., 2010; Pijanowski et al., 2009). Under these circumstances, oftentimes economic benefits alone are not adequate to compensate for the stress and adverse working conditions principals face (Pijanowski et al., 2009). Therefore, principals often seek the principalship in schools and districts with the community environments that are more satisfying and compatible with their own psychological needs (Behling et al., 1968; Pounder and Merrill, 2001). Thus, many nonpecuniary working conditions, such as workload, autonomy, district/teacher/parent supports, and professional development and career advancement opportunities, are also important concerns for many principals when considering the entry, mobility, or exit of the principalship (Farley-Ripple et al., 2012a; Loeb et al., 2010; Pijanowski et al., 2009).

Given the broad range of nonpecuniary working conditions and the lack of measurements of many possible causal factors such as principal autonomy and district support, very limited empirical research has examined the relationship between nonpecuniary working conditions and principal turnover (Fuller et al., 2015; Tekleselassie and Villarreal, 2011; Yan, 2020). For instance, Fraser and Brock (2006) applied narrative surveys and structured interviews on 47 random principals in elementary and secondary schools in New South Wales, and identified incentives and disincentives of working conditions that influence principal turnover. The incentives included district support, professional development opportunities, union, support from teachers and parents, available resources, as well as principal autonomy to make decisions. The disincentives of principal working conditions included a sense of isolation, stress from work, insufficient remuneration, staff issues, demanding and disgruntled parents, and unrealistic expectations from employing authorities.

These trends are also similar for principals in the United States. In a case study with more than 100 administrators' career transitions within Delaware education system, and semi-structured interview data from 48 principals and assistant principals, Farley-Ripple et al. (2012a) found that economic benefits, working relations with multiple stakeholders (teachers, parents, school districts, and school boards), as well as the availability of opportunities into administration or the district central office are all critical incentives for principal retention.

Fuller et al. (2015) summarized four indirect yet powerful working conditions that influence principal turnover in small and mid-sized urban districts. These four factors include state policy, leadership preparation programs, principal autonomy, and district policy. They found that intrinsic rewards, overall workload, and a feeling of effectiveness were important factors influencing principal retention. Moreover, principals in small and mid-sized urban districts perceived state accountability policies and statewide testing systems, as well as principal workload, to be more influential than those in other districts. More recently, Yan (2020) utilized multinomial logistic regression on national survey data from National Center for Educational Statistics (NCES), and examined how contract type, school disciplinary environments, workload, professional development, and principal influences in school are associated with different types of principal turnover.

The non-pecuniary working conditions that influence principal turnover include principal workload, school disciplinary environments, and principal influences on school decision making. In terms of workload, the balance of professional and personal lives reflects principals' concerns over their life quality and health (Pounder and Merrill, 2001). Therefore, a heavy workload and extra responsibilities are regarded by principals as unattractive job attributes that affect the job desirability. Analyzing the influence of principal workload on principal turnover intentions, Tekleselassie and Villarreal (2011) conducted a three-level Generalized Multi-level Model based on Schools and Staffing Survey in 2003–2004, and found that work overload was unrelated to principals' departure intentions, but increased the intentions of principals changing schools. They speculated that a heavier workload could cause principals to consider transferring to another school that has a lighter workload and shorter working hours. Moreover, Fuller et al. (2015)'s descriptive analysis indicates that workload is among the most important concerns for principal retention.

For school disciplinary environment, empirical studies indicate the positive relationship between disciplinary environment and principal retention (Loeb et al., 2010; Sun and Ni, 2015; Tekleselassie and Villarreal, 2011; Yan, 2020). For instance, Yan (2020) found that one standard deviation improvement in school disciplinary environment rating lowers the odds of principals moving to another school by 36.4% relative to staying. By further separating school disciplinary environment from student characteristics regarding the effects on principal turnover, this study indicates that as school disciplinary environment rating increases by one standard deviation, the odds of moving to another school for principals in schools serving the highest quartile of students of color are

about 1/3 lower than those in other schools. It indicates that improving school disciplinary environment plays a more important role in lowering principal turnover in schools serving high concentrations of students of color.

Another important factor that influence principal turnover is principal influence in school decision making. Principals need adequate autonomy to work with school communities to establish and achieve meaningful school improvement goals and cultivate positive school culture (Fink and Brayman, 2006). Providing principals with adequate autonomy allows them to develop shared vision and efforts within the school communities, thus facilitating school improvement goals and enhancing student learning (Fink and Brayman, 2006; Hargreaves and Goodson, 2006). However, if states and local school districts exercise excessive influence on setting directions, establishing policies, and hiring teachers, principals may feel themselves as “puppets” without influential power on school reforms and have little leeway to influence school decision making (Tekleselassie and Villarreal, 2011).

Among all the areas upon which principals exert their influence, the areas of recruiting effective teachers, transferring teachers, and discharging unsuitable teachers are where principals experience the greatest gap between the authority they need in order to make changes in school and the actual influence they possess that is delegated from the district central office (Adamowski et al., 2007). This “autonomy gap” is especially true for principals in urban and low-performing schools (Adamowski et al., 2007; Papa and Baxter, 2008). Lack of influence over major decisions on school matters could hurt principals’ emotions in school reforms and job satisfaction, which causes principals transfer to another school, or even leave the education system (Adamowski et al., 2007).

Therefore, the lack of influence over supervision (e.g., principals’ perceived influence over spending, teacher evaluations, hiring teachers, and disciplinary policies) are often significantly associated with principals’ departure and mobility intentions (Tekleselassie and Villarreal, 2011). Furthermore, Yan (2020) found that principals having more influence on determining teacher professional development and budget spending and less influence on setting performance standards are associated with a lower likelihood of principals leaving the education system.

Summary

Principal leadership plays a significant role in school improvement and student success, therefore, the retention and sustainability of principals has a substantial impact on student success and the education system. Frequent turnover of school principals often has negative impacts on school success, thus it is critical to examine how various factors are associated with principal turnover. This article applies Microeconomic Labor Market Theory and categorizes the influencing factors and their interactions of principal labor markets from the supply side, demand side, and policy environment perspectives. Additionally, utilizing Job Choice Theory, this article examines how principals’ career choices are affected by objective and subjective factors.

With the guidance of the two frameworks, this article has reviewed factors that are associated with principal turnover from three dimensions: principal characteristics, school context, and working conditions. Overall, most principals’ demographic and professional characteristics have not shown a consistent impact on principal turnover. These findings could be supported by Job Choice Theory, as each principal holds his/her own objective and subjective perspectives as well as individual preferences regarding the relative importance of multiple aspects of factors in their job decision making.

In terms of school contextual factors, many schools with more low-income, low-achieving students, students of color, and less-qualified teachers are disadvantaged in terms of the ability to retain quality principals. These schools often have principals who have less experience, less education, and have attended less selective colleges. Furthermore, these disadvantaged schools are often used as “stepping stones” for principals to more desirable schools, which may partly explain the higher principal turnover rates in these schools.

Compared with principal characteristics and school contextual factors, research on how on the relationships between principal working conditions and principal turnover is rather limited. With the expanding roles and responsibilities of principals to improve student success, economic and non-pecuniary working conditions are playing an increasingly significant role in principals’ job satisfaction and retention. Factors such as salary, contract type, school disciplinary environments, workload, and principal influences in school have a significant impact on principal turnover.

Given the limited research on principal turnover, more empirical research remains to be conducted to unravel the patterns and dynamics of principal career transitions and factors that influence different types of principal turnover. For instance, longitudinal studies could be examined to study the dynamic transition of principals over time. Additionally, qualitative research methodology such as case study or focus groups could be applied in order to obtain an in-depth understanding regarding voluntary vs. involuntary reasons behind different principal transitions and various organizational factors that influence principal retention. Moreover, researchers could conduct more inter-disciplinary research on principal career transitions that apply theories of labor economics, psychology, and leadership in order to reveal the economic and psychological reasons that drive principals’ career transitions, and mitigate the negative influence of principal turnover on school system.

Introduction

For the past three decades, school leadership researchers have been dedicated to studying school principals' role in developing schools into effective, efficient, and equitable learning spaces (OECD-CEPPE, 2013). Much academic attention has focused on approaches to school principals' leadership for learning, including, for example, distributed, collaborative, democratic, facilitative, participative, transformational, and ethical leadership, as well as functional, structural and cultural initiatives (Leithwood, 2001; Leithwood and Jantzi, 2005; Cheng et al., 2016; Gordon and Patterson, 2006; Catano and Stronge, 2007). Also, researchers have sought to address the effects of leadership approaches on students' outcomes (Barber and Mourshed, 2007; Leithwood et al., 2020). Yet, there seems to be a shortage of academic literature on existing approaches to assessing school principals for accountability and developmental purposes (Catano and Stronge, 2007; OECD-CEPPE, 2013). This chapter focuses on the education policy perspective and provides an overview of existing school principals' evaluation systems in several contexts worldwide.

This review is necessary because, as demonstrated in an exploration of the ERIC database in January 2021, school principals' evaluation is a less common area of research. While the term "teachers' evaluation" yielded more than 36 thousand publications since 2002, a few more than three thousand papers on school principals' evaluation were found in the database during the same period. From an education policy perspective, primary and secondary teachers have mainly been evaluated to decide on incentives, continuing professional development, and sanctions (OECD, 2005; Isoré, 2009; Villegas-Reimers, 2003; Guerriero, 2013; Martinez Rizo et al., 2016; Akiba and Liang, 2016; Polikoff and Porter, 2014; Kane et al., 2014; Kane and Douglas, 2012) and individual teacher evaluation and appraisal is seen as a key lever of school improvement (Thomas, 2020; Cortez Ochoa et al., 2018). In contrast, school principals are typically addressed differently; for instance, they are expected to achieve certifications for leading and managing via Diploma courses (Bush and Glover, 2016). In addition, they may undergo school inspections and assessments (OECD-CEPPE, 2013; DOF, 2013); however, evaluations are generally targeted at the school level rather than just the individual, as it usually happens with teachers. Given school principals' unique position as gatekeepers of education reform and promoters of productive environments for quality and equitable teaching and learning, this chapter contributes new light on current approaches to school principals' evaluations and the role this plays in educational accountability and improvement.

Regarding the accountability purpose of assessments, Leithwood (2001) identified four approaches that directly impact school leaders and schools. One of them is the creation of quasi-markets, that is, the education service emulating the assumed dynamics of the market, which allows parents to choose schools that, from their perspective, provide better quality and value. The second relates to decentralization: the devolution of responsibility of academic attainment to the schools, which holds them directly accountable. A third approach is the introduction of professional standards, which are, typically, government-created policy criteria specifying the expected performance of teachers and principals (Catano and Stronge, 2007; OECD-CEPPE, 2013), often explicitly linked to raising academic students' performance. Finally, management and strategic planning is seen as a method that school principals and staff are expected to use to maintain their institutions' working order to efficiently use resources and be effective in their outputs, i.e., educational indicators.

Although we acknowledge that school principals' evaluation, attitudes to school leadership, and impact on educational outcomes are rather inseparable, we seek to address the former area of inquiry due to its less common reference in the literature. Moreover, we recognize that while the term evaluation relates to the broader realm of performance monitoring, assessment refers to the practical and situated process of measuring or determining the extent of adherence to expected competencies and results (Goldring et al., 2009). Nevertheless, given the variety of uses given to school principals' assessments internationally, we use the terms interchangeably in this paper. The chapter is organized as follows: first, the methodology for the review is explained. Following this, a general scope of the literature is presented to highlight critical areas of school leadership assessment internationally and a brief review of 21 selected country contexts illustrating existing standards for school principals. The paper focuses on approaches to evaluation, including the most commonly used evaluation instruments. The review continues by synthesizing the link between school principals' evaluation, accountability, and professional development, and a conclusion is provided.

Methodology

This review addresses existing evaluation approaches to school principals drawing on academic research available on the internet, specialized journals, policy reports and official websites, consultations with experts in the field of school leadership, and the "gray" literature, for example, published masters and Ph.D. dissertations from 2000 to 2021. The key terms used for this review were as follows: "evaluation AND school principals" and its associated terminologies, for example, assessment, appraisal, headteacher, and school leader. Databases consulted included ERIC, ProQuest, Ethos, and Google Scholar in English. Redalyc, Scielo, and Dialnet in Spanish. Leading journals about school leadership were scanned, including the *Journal of Educational Leadership*, *International Journal of Leadership in Education*, *Educational Administration Quarterly*, *Education Policy Analysis Archives*, and *International Journal of Educational Management*.

The evidence presented focuses on 21 selected country contexts exemplifying existing school principals' evaluation approaches and the instruments most commonly employed for this purpose. Several studies precede this review, however, focusing on different aspects of school principals' accountability (OECD-CEPPE, 2013; OECD, 2013; OEI, 2017). The contribution of this chapter to existing knowledge lies in the identification of evaluation systems where there is a clear link with professional development schemes. Furthermore, the paper summarizes current practices in low- and middle-income contexts challenging to locate in the international literature.

Literature review

Educational Effectiveness Researchers agree on teacher quality and school leadership's critical role for quality education improvement (Reynolds et al., 2014; Mortimore et al., 1994; Kyriakides et al., 2018; Muijs et al., 2014; Scheerens, 2015; Day et al., 2006). Furthermore, it is believed that good school leaders can positively impact staff performance, community and parental engagement, and indirectly, pupils' academic outcomes (Goodall, 2018; Leithwood et al., 2020). Therefore, various approaches to accountability and motivation of teachers and school principals have been introduced worldwide, and Appendix 1 summarizes the 21 countries included in this review. Previous reviews in the USA indicate that although school principals are evaluated across the country, existing approaches present mixed evidence on their suitability to improve educational indicators. In many cases, they lack research-based support (Goldring et al., 2009; Davis et al., 2011). School principals' appraisals can be defined as "procedures involving external evaluators that seek to identify school leaders' strengths and weaknesses using objective criteria in order to make a judgement about their competencies for performance management, employment-related decisions and/or rewards purposes" (OECD, 2013, 492).

Like teacher evaluation systems, school principals can be subjected to assessments at two distinct points and for various reasons: before the appointment, for example, to verify suitability for the job, as well as once in the post. The latter is typically motivated by an interest in monitoring compliance to standards and regulations to determine permanency in the job, pay-related decisions, and advising on further professional development. Still, the specificities of school principals' evaluation might differ from those of teachers, depending on the country. While educational authorities centrally steer most school principal evaluation systems, there are other ways they are examined at the school community level. For instance, Gordon and Patterson (2006, 206) "view school leadership as a relational, context-specific process that considers the culture, norms, values, and beliefs of the individuals involved with the school and community". This implies that school principals may be required to meet national standards and are subject to expectations on their functions and ingrained in power negotiations at the community level (OEI, 2017).

In their literature review, Goldring et al. (2009) propose that school principals' evaluation revolves around two main aspects: what to assess and how to assess it. Regarding the former element, they suggest that four areas dominate: (a) responsibilities, (b) knowledge and skills, (c) processes, and (d) organizational outcomes. How to assess principals varies widely, and commonly a mix of instruments integrate a given evaluation system. Following Goldring et al. (2009) twofold distinction, we explore existing standards for school principals followed by current approaches to school principals' evaluation. Next, we report research on the most common evaluation instruments for principal's assessment and dedicate a section to understand the link between school principal's assessment and professional development.

Standards for school principals

Standards are typically depicted as descriptors of minimum performance in a given job. In education, standards are meant to orient teachers' and principals' day-to-day duties and might be used for hiring, evaluating achievement, make employment decisions, among other purposes (Cortez Ochoa et al., 2018; Wildy et al., 2011; Zheng, 2020; Catano and Stronge, 2007). A literature review on the topic suggests that Principal standards may focus on one or both general aspects: (i) professional functions and (ii) behavioral skills (OECD-CEPPE, 2013). Professional functions embrace setting the school's mission and liaizing with organizational and developmental aspects of teachers, for example, maintaining harmony in the school and orienting professional development. Behavioral skills include flexibility to cope with change, good communication, values, and the linkage between theory and practice (OECD-CEPPE, 2013). In this regard, Catano and Strong conclude that "defining the role of the school principal is a difficult task due to a complex set of job responsibilities, skills necessary to perform the job and values" (2007, 383).

The conceptual development of standards for school principals varies from place to place. While in some countries these are decided and enforced at the national policy level (e.g., Chile, Mexico, and Rwanda), in others, this happens at the regional policy level, regardless of the existence or not of national criteria (e.g., in Australia, Canada, Brazil, among others). Furthermore, the standards can be introduced top-down, as well as bottom-up. In some contexts, political authorities decide on the standards' content and means of observance (for example, Colombia, Ecuador, England). In contrast, in others, professional bodies or teachers' organizations can agree upon these criteria to frame their profession (e.g., Australia, Chile, New Zealand) (OECD-CEPPE, 2013). In some contexts, standards are mandated across different levels of governance (for instance, the USA). In this regard, Catano and Stronge (2007) note that the co-existence of standards of principals at national, state and local levels in the USA makes appraising the work of school principals harder.

Unlike standards expressly developed for teachers, the literature shows that school principals' standards are usually less precise in defining different performance progressions (OECD-CEPPE, 2013; Ni et al., 2019). Moreover, Romero and Krichesky (2019) found that professional standards are equal for teachers and school principals in Argentina. This lack of precision in standards to specify the career development of school principals might be because, contrarily to teachers, who might be encouraged to display incremental performance throughout a career, school principals seem to be expected to perform equally well from appointment through to retirement. Still, there are exceptions to the latter, such as Australia's Standard for Principals (AITSL, 2014). The Standard is organized into three leadership requirements and five professional practices, and seeks to inform professional profiles, particularly regarding two areas: Leadership Requirements and Professional Practices (AITSL, 2014). These criteria are adapted to the principal's school context and career stage. See Fig. 1.

Fig. 1 The Standard for Principals—Australia. Source: AITSL (2014, 10).

Also, in Shanghai, China, the National Professional Standards for Compulsory Education Principals (NCEE, 2021) orient the progression from novice to Master Principal, and this development is explicitly structured by seniority, recognizing iterative mentoring from more experienced educators to support advancement, among other aspects that form part of a culture in this context. Shanghai is noteworthy as school principals typically transit a teacher career ladder before applying for a leadership position. This means that the extent of understanding the education system that school principals might achieve is outstanding. With the introduction of the new professional standards in 2013, principals are expected to deliver in instruction, organizational and school culture management, good relationships with the community, and professional development (Liu et al., 2017).

As can be seen in [Appendix 1](#), although the sole existence of Principal standards—or lack of them, as in Nicaragua and Costa Rica (Borden, 2002; OEL, 2017)—does not directly relate to the enactment of Principal evaluation systems (OECD-CEPPE, 2013), in some contexts, assessments have been introduced, as examined next.

Methods for evaluating school principals

Explicit professional standards are essential to designing and introducing evaluation schemes, as we noted in our previous review of teacher evaluation systems (Cortez Ochoa et al., 2018). Once criteria of what school principals should know and do are developed, these guidelines can help devise suitable methods to assess performance. In line with this view, Catano and Stronge indicate that “(1) principals’ performance evaluation should be fair and equitable; (2) [...] be based upon what they are expected to do; and (3) [...] evaluation instruments should match the expectations framed within state and professional standards” (2007, 385). Different approaches to evaluating school principals can be found, among which school inspections are one of the oldest and most commonly applied worldwide.

School inspections

School inspections have been a tradition in various European countries starting around the mid-19th century (Altrichter and Kemethofer, 2015). Through this assessment method, evaluators monitor and closely observe the school’s compliance with performance standards. Often, inspections are carried out by external personnel, such as civil servants or equivalent, who review documentation and student assessment data from the school and may also gather information from direct observations and internal school self-evaluation. Inspections typically result in an overall evaluation and potential recommendations for improvement. England has a long practice in this respect, and several examples can be found in the USA. In Latin America, this is a commonly found approach and is currently used in Brazil, Chile, Costa Rica, Cuba, Nicaragua, and the Dominican Republic. Following a recent reform in the Emirate of Abu Dhabi, school inspections were introduced. In a handful of cases, school inspections are meant to review school improvement plans; we identified this in Argentina, Chile, Costa Rica, Ecuador, Rwanda, and Spain.

Inspections can focus to differing extents on accountability or improvement purposes and contribute to School Principal professional development routes, as we discuss later. Nevertheless, the method has been found to contribute to stress and discontent. For instance, an online survey with 2300 school leaders in seven European countries revealed that among the case studies, The Netherlands and the UK reported high levels of perceived pressure coming from school inspections (Altrichter and Kemethofer, 2015). This investigation found that high-stakes consequences attached to checks contribute to principals’ perceptions of stress. Also, pressure effects on various developmental realms, such as promoting/improving self-evaluation, are found among countries with stricter high-stakes consequences from inspection outcomes. The study’s findings indicate that the perceived burden of inspections also leads to unintended consequences, such as a diminution of innovative teaching and curriculum shrinkage. There is much emphasis placed on the capacity of inspectors to exert unbiased judgments on a school’s performance and the principal’s competency to lead the institution. Thus, the reliability of this approach should be carefully considered when using inspection as a method of principal assessment (Martínez Rizo, 2016).

Self-review

Increasingly common in the toolkit for school principals’ assessments, self-evaluation is a method external evaluators use to ponder the extent of standards’ accomplishment, based on records provided by the school principal. We identified that this approach is utilized in Australia, Chile, Dominican Republic, New Zealand, Scotland, and Abu Dhabi. The specific characteristic of this technique is context-specific, including leadership portfolios, administrative records, etc. This type of assessment might be used alongside other instruments, for instance, written examinations, as in Australia and the Dominican Republic. Scotland is unique because self-evaluation is the primary method to appraise the school principals’ performance and is directly linked to professional development (The General Teaching Council For Scotland, 2012).

As much a progressive approach self-reviews appear, mainly as these are found around discourses of teacher agency, criticism persists on this method as paradoxically centering the limelight on accountability rather than professionalism (Priestley et al., 2015). Making up evidence of good performance is a potential pitfall of self-evaluation tools and approaches, especially when there are consequences for the job attached to them (Webb, 2006; Ball, 2003). Several examples from the USA and the UK provide grounds to recommend caution when self-review is meant to decide principals’ incentives and sanctions.

Written assessments

Principal exams, especially those employing multiple-choice items, were found in more than half the 21 review contexts. Although tests might be used as part of school principals’ evaluation once in the post (e.g., Brazil, Costa Rica, Cuba, Dominican Republic,

Ecuador, Mexico, among others), often, written assessments are used for hiring, as in Argentina, Australia, Colombia, Peru, and the USA. Tests provide the possibility of having a comparable measure between different candidates' competencies. Thus, it serves a practical purpose and might be cost-effective when deciding who to grant a principal's role and determine the extent of mastery of the professional duties related to the position.

We also found that, increasingly, exams integrate hypothetical scenarios or vignettes meant to assess how the respondent would react to a given situation in the school (Wildy et al., 2011). However, the intention of these fictitious circumstances might not be ideal as a proxy of actual competency. There is much debate in the literature regarding the validity and reliability of written exams to assess pedagogical knowledge, subject knowledge, and other types of skills and competencies unique to school principals (Darling-Hammond, 2001; Hill et al., 2004; Mayer and Mills, 2020; Molina et al., 2018), some of which we discussed in the previous section. Therefore, its use in combination with other indicators of suitability for the role seems appropriate (Steinberg and Sartain, 2015).

Surveys with the school community

Among the cases reviewed in this chapter, we identified seven contexts where school principals' evaluations incorporate the views of the staff and the broader community. These instances are Australia, Brazil, Chile, Cuba, England, New Zealand, and Paraguay. The procedures concerning data collection vary, from centralized electronic forms sent to the schools, to the co-participation of an inspector who conducts interviews or disseminates questionnaires. Two cases stand out due to the involvement of school boards: England and New Zealand. In these cases, parents, teachers' representatives and people from the community may provide input regarding the perceived performance of the school to hold the principal to account (National Governance Association, 2019; DfE, 2017; NZSTA, 2021).

Another notable case is Brazil, where school principals' hiring may be organized around a democratic election where parents vote for a candidate to become the new head of school (Aravena, 2020). These examples resonate with Leithwood's (2001) research regarding the role of quasi-markets, school autonomy, performance-related monitoring, and approaches to school leadership and management in the accountability of school principals. Notably, where decisions on the school principal's performance are in the hands of a broader group of individuals, appropriate training, communication, and alignment with standards should ensue.

Student learning indicators

Invariably, school principals' evaluations seek to impact students' outcomes positively. We found that in some countries, school principal evaluation utilizes students' learning indicators alongside other measures, which happens in Australia, England, Shanghai-China, and the USA. Still, how these measures are factored into a school principal's assessment varies. For example, in the USA, Chiang et al. (2016) studied the suitability of school value-added to evaluate principals' effectiveness. Using Pennsylvania's longitudinal data, they concluded that such metrics are poor indicators of principal's effectiveness. Loeb and Grissom (2013) arrived at similar conclusions. The use of school value-added, which accounts for growth in students' results in standardized tests across time, has been critiqued due to its limitations in isolating the effects of principals from anything else beyond their control. It has proved challenging to quantify the principals' effects while accounting for teachers' effects. However, a recent systematic synthesis of six longitudinal studies involving more than 22 thousand principals in the USA found that

a 1 standard deviation increase in principal effectiveness increases the typical student's achievement by 0.13 standard deviations in math and 0.09 standard deviations in reading. [In other words], replacing a below-average elementary school principal (i.e., one at the 25th percentile of effectiveness) with an above-average principal (i.e., at the 75th percentile) would result in an additional 2.9 months of math learning and 2.7 months of reading learning each year for students in that school.

Grissom et al. (2021, xiii).

Still, the authors acknowledged that more research is needed to understand how principals' effects on learning are mediated by their interventions in recruiting and maintaining effective teachers in the school. Mainly because most principal impacts on students' achievement are indirect, with some evidence of direct effects, such as behavioral management. In other words, principals' effectiveness can be challenging to measure and plausibly context-situated, fluid rather than static. It is critical to reflect on research that has used measures of school value-added to determine school principals' effectiveness, given this approach makes several assumptions about the role of school principals in matters of students' outcomes growth. For example, when it is suggested that replacing less effective with more effective principals, this idea somehow assumes that principals arrive at schools to exert changes without any resistance from existing personnel, students, and parents and that their predicted effectiveness pertains to them, and not to the various factors around them, which might also shape their approach to educational growth. Given the complexity underpinning these latter contentions, an in-depth review in a separate space would be worthy.

Our review identified several instances where the intention was to collect data on students' outcomes, however, this happens indirectly. In Abu Dhabi, Brazil, Costa Rica, Ecuador, Paraguay, Rwanda, Scotland and Spain, principals must provide administrative records of school exam performance. Research contests the limitation of this appraisal form, mainly because of the risks of cheating, especially when high-stakes consequences are attached to the evaluations (Carpenter et al., 2014; Webb, 2006; Ball, 2003).

The evaluation of school principals might lead, as mentioned earlier, to a series of decisions on their job and professional career. In addition, it has been consistently agreed that centralized evaluation systems, for example, steered at a national or state level, usually stress the accountability and high-stakes consequences side of the assessments (OEI, 2017). We identified that school

principals' assessments in less than half of the reviewed countries (8 out of 21) focus on the individual, while the rest combine school and individual evaluations. England and New Zealand stand out given their emphasis on school monitoring for accountability purposes. The following section examines the link between the school principal's evaluation and opportunities for professional development.

School principals' professional development

One of the primary reasons for school principals' evaluations is to support their professional development and, eventually, positively impact their school communities' outcomes. A review of the literature in the USA identified that school principals are more receptive to assessments that align with their expected professional duties and contribute to their professional development in areas that are relevant to their schools and contexts (Davis et al., 2011). In this research, we identified that in all reviewed countries, there exists a training component after the appointment. Still, their features could not be fully untangled via the available literature or official documentation. We noted that the main topics on offer are school management, leadership, evaluation, legislation, and less commonly, curriculum and ICT skills. In two cases: Colombia and Scotland, the evaluation system is meant for the school principal to decide and customize what professional development they need. In Costa Rica, Shanghai-China, Nicaragua and Paraguay, school principals are expected to achieve a number of professional development hours. Mentoring programs were less commonly found, only reported for England, Rwanda, Scotland, and Shanghai-China. In the case of Rwanda, development partners have introduced Diploma and Certificate CPD for current principals with The University of Rwanda-College of Education (URCE) and the Rwanda Education Board (REB) (VVOB, 2019).

In the broader literature, the professional development of school principals is typically found in any (or a mix) of the following types: traditional workshops and seminars; peer development, such as one-to-one mentorship; and programs aimed at developing the principal's investigative skills (Berkowitz et al., 2019). Mentoring schemes supported by experienced peer school leaders and professional development initiatives in everyday settings are particularly appealing to school principals as a suitable method for improvement (Hamilton et al., 2012; Christie et al., 2019). Mentoring and coaching programmes can be found in several Australasian countries (Macpherson, 2009), although the specificities and combination with other training vary from place to place. In general, opportunities for professional development must be congruent with the identified strengths and pitfalls of the school principal's performance in an evaluation (Hamilton et al., 2012). This is critical for the credibility of assessments and the eventual improvement of leadership and schools.

Conclusions

This chapter presented an overview of current school principals' evaluation approaches, drawing on examples from 21 countries. The literature from the last twenty years shows that professional standards for school principals and assessments are widely used in many contexts. The instruments for assessment vary substantially in every context analyzed; still, the most commonly identified approaches in this review include school inspections, self-reviews, written examinations, community surveys, and student learning indicators. In the cases examined, mechanisms targeted at CPD provision exist, although these varied substantially. We chose to focus on the developmental side of school principals' assessments, given their potential for school improvement.

The study of the effects of school principals on students' outcomes is an area still in exploration with no definite conclusion in some cases (Golding et al., 2009; Davis et al., 2011), although very recent findings have been more positive (Grissom et al., 2021), indicating that effective school principals matter for students' academic growth. Most importantly, given the indirect impact of principals via teachers, school management, and other realms, it is sensible to understand the positive impacts of effective school principals in their intricate nature as leaders, colleagues, administrators, and potentially many more phases. Research recommends caution in focusing on educational outcomes solely in the context of principal evaluation, potentially overlooking the rest of the school principal's tasks within the school community that also influence results (Golding et al., 2009), including those related to behavioral management (Grissom et al., 2021).

In revisiting their highly regarded paper "Seven strong claims about successful school leadership", Leithwood et al. (2020) provide a more nuanced approach to the influence of school principals in students' academic outcomes. In the light of recent evidence, they maintain that principals are important within-school factors, but reflect on current knowledge about the influence of other contextual and out of school factors that more directly explain school effects on students' attainment, in line with the Educational Effectiveness literature (Creemers and Kyriakides, 2006; Reynolds et al., 2012; Scheerens, 2015). There is enough evidence to suggest that school principals can influence students' achievement, and therefore, Leithwood and colleagues' seminal work remains relevant (OECD-CEPPE, 2013; OECD, 2013; Day et al., 2009; Grissom et al., 2021). More importantly, continuing studying school principals' evaluation can be a powerful tool to help decision-makers and researchers understand better ways to support principals' professional development, schools and learning.

Future research might need to ponder the feasibility of assessing the effects of school principals on educational outcomes, especially when leadership is increasingly a shared responsibility at the school and system levels (Daniëls et al., 2020; Leithwood et al., 2020). This might require sophisticated methodologies capable of factoring in teachers' and educational authorities' forms of leadership. Most importantly, such approaches should also offer information on how principal evaluation can provide a means to enhance teaching and learning. Some additional responsibilities being transferred to schools include the emotional development

of students and teachers, their contribution to environmental sustainability, fighting racism, among others (see also, [Facer, 2021](#); [Saeed, 2020](#); [Sriprakash et al., 2020](#)). Thus, looking more closely at the validity, reliability, and unintended consequences of school principal evaluation methods and the potential to improve the employed measures is also a critically important focus for further research.

Limitations

Given the space limits, a selection of school principals' evaluation approaches had to be made, potentially omitting other systems that could provide additional elements to our understanding of the topic. [Avalos \(2016\)](#) suggests that colonial legacies play a critical role in the standards and approaches to teacher education and regulation. In that sense, it is expected that, for instance, methods used in Canada and Australia share characteristics with those used in the UK; similarly, Latin American contexts might rely on frameworks close to those from Spain or Portugal. Research in China further shows that standards are increasingly based on Western frameworks, such as the USA's ([Liu et al., 2017](#)), suggesting that policy borrowing may also be a phenomenon for future study. Still, the school principal's evaluation is a dynamic arena that evolves to respond to context-specific needs, as demonstrated by some of the cases explored. Therefore, the review is even more relevant now.

Furthermore, there are several equally essential aspects related to school principals' evaluations that deserve tailored review. These include the governance of school principals' evaluations, their recommended frequency, and the utility of assessments for other school leaders different from the principal. Some of the references in this paper articulate these areas, *albeit* to varying extents, and thus, we encourage its exploration. We trust this chapter served its purpose of providing a much-needed update on the matter of the title and that as the field unfolds, new knowledge will be needed.

Appendix 1

Country	Standards or criteria for school principals	Evaluation methods and instruments	Relationship with professional development	Accountability at the individual level, the school level or both	Selected references
Argentina	Do not exist. Romero's and Krichesky's (2019) study in five provinces found that school principals have equal regard than teachers in current normative and that requirements depend on provincial legislation.	Entry requirements: • A teaching degree • Be a teacher before applying for a promotion to school leader • Teaching experience • Good notes on performance assessment • A written exam • An oral defense of a school improvement plan To retain the post • Once granted, a school principal remains in the position until retirement	Vary substantially from province to province and might relate to: • Management of school staff development • School leadership and the context • Curriculum management • ICT	Individual (only for hiring)	(OEI, 2017 ; Romeo and Krichesky, 2019)
Australia	National professional standards for principals and the leadership profiles	• Self-review of school improvement plan (typically reviewed annually). • Additional datasets on student achievement, teacher and community surveys. • Written assessments with hypothetical scenarios^a.	• Professional development decisions included in the Performance and Development Culture accreditation program^a.	Both	(Gurr, 2007 ; Wildy et al., 2011)

(Continued)

Country	Standards or criteria for school principals	Evaluation methods and instruments	Relationship with professional development	Accountability at the individual level, the school level or both	Selected references
Brazil	Each region monitors school principals using specific criteria	Entry requisites (Rio de Janeiro) • Five years of teaching experience and a teaching degree (direct democratic vote from school staff and the community) Other assessment instruments in different regions: • Paper-based questionnaires • Interview • Observation protocols • Administrative registers	• Traditional courses and seminars. These courses vary in different regions.	Both	(OEI, 2017; OECD, 2019; Aravena, 2020)
Chile	Marco para la Buena Dirección y el Liderazgo Escolar [Framework for Good Management and School Leadership] Practical dimensions • Constructing and implementing a strategic and shared vision • Developing professional capacities • Leading teaching and learning • Managing convivence and the school community's participation • Developing and managing the school Personal resources • Principles • Abilities • Professional knowledge	In agreement with the local authority or founder: • Self-evaluations • School development plan reports • Superintendent report • Focus groups with teachers and parents	• A mentorship scheme including technical support is currently in development. • Potential providers are universities, specialized development centers, and existing institutions concerned with teacher CPD.	Both	(MINEDUC, 2015, 2020; Benavides Moreno et al., 2019; Berkowitz et al., 2019)
Colombia	Estatuto Docente, Decreto Ley 2277 (1979) [Teaching Decree, Law 2277 (1979)].	Entry requirements: • A written exam on general and pedagogical knowledge • Critical reading • Administrative management • Academic management • Psycho-technical evaluation • Interview Continuous formative assessment • The teacher selects observable and measurable evidence of compliance to the Law. • A Personal and Professional Development Plan addressing four aspects: management, pedagogy, administrative duties, and relationship with the community.	• The Personal and Professional Development Plan is seen as contributing to the teachers' reflexivity and enhancement.	Individual	(OEI, 2017; Aravena, 2020)

Country	Standards or criteria for school principals	Evaluation methods and instruments	Relationship with professional development	Accountability at the individual level, the school level or both	Selected references
Costa Rica	There are no standards. Assessments are aligned with current legislation: Decreto Ejecutivo N° 38170- MEP February 13, 2014 [Executive Decree Ejecutivo N° 38170- MEP February 13, 2014].	• School supervision (observation protocols) • Administrative records • Paper-based questionnaires (aligned with learning content from Costa Rica's university programmes in education) 70 items addressing the following: • School project planning • Research • Education legislation • Administration • Professional ethics • Educational planning • Statistics • Paper-based questionnaires • Observation protocols • School management records • Administrative records • School community surveys	• Hybrid modules of 40 h seminars in total. Topics include: • Leadership, conflict management • Evaluation and monitoring of educational programmes • Educational legislation • Human resource management	Both	(Borden, 2002; OEI, 2017; Oviedo Bogantes, 2017)
Cuba	The certificate of evaluation sets the personal and professional attributes of school principals. • Personal qualities • Communicative skills • Indicators on ethics, discipline and efficiency • Organizational and managerial attributes • Results	• Paper-based questionnaires • Observation protocols • School management records • Administrative records • School community surveys	• Feedback via methodology exchange with inspectors.	Both	(Maturell Aguilera and Valiente Sandó, 2016; OEI, 2017)
Dominican Republic	Teachers and school principals performance standards. • Promote a vision and school development plan with the community • Manage, organize, and supervise teaching and learning • Procure an environment for effective learning • Promote the staff's professional development • Encourage the families and the community to participate with the school • Self-professional development	• Evaluation via a rubric by the immediate authority above the school principal • Self-evaluation • A written exam	The School of Principals for Quality Education (EDCE in Spanish) provides tailored professional development courses.	Individual	(MINERD, 2014a,b; IDEICE, 2017; OEI, 2017; Vaillant, 2019)
Ecuador	Quality standards for school principals' performance • Institutional management • Pedagogical management • Convivence, school participation and co-operation • School safety	Entry requirements • Teaching degree and a postgraduate degree in education • To pass all assessments • Five years of teaching experience • To master an indigenous language where applicable Continuous evaluation • A written exam with 60 items with four response options each. The test includes questions on the following: • Educational administration • Basic accounting • Curricular planning • Strategic planning and project design • Educational assessment • Psychology in education	• Mentorship and induction programmes • Regular workshops and Diploma courses	Individual	(Ministerio de Educación, 2010, 2017; OEI, 2017)

England	The Headteachers' standards 2020 are organized in two sections: (1) Ethics and professional conduct; and (2) Headteachers' standards, which include: (1) School culture, (2) Teaching, (3) Curriculum and assessment, (4) Behavior, (5) Additional and special education needs and disabilities, (6) Professional development, (7) Organizational management, (8) Continuous school improvement, (9) Working in partnership, (10) Governance and accountability.	Governing bodies undertake tailored performance management, including: • 360-degree feedback, • Leadership portfolio, • School inspections (Ofsted), • Staff, and student interviews.	Professional development programmes, such as mentoring and specific training at accredited institutions, and via school-based development.	Both	(Altrichter and Kemethofer, 2015; DfE, 2020; Eurydice, 2021)
Mexico	Professional profile with a series of dominions, criteria, and indicators regarding: • Professional practice and professional development in line with philosophical, ethical, and legal principles of Mexico's education. • Recognition of the function to promote a school culture grounded on equity, inclusion, interculturality and excellence. • School organization to promote the integral development of girls, boys, and adolescents. • Promotion of shared responsibility between the school, families and educational authorities.	The recently introduced System for the teachers' career mandates sitting computer-based tests for promotion and salary improvement. The evaluation considers: • Professional trajectory • Content knowledge and administrative knowledge	• Individualized written report of performance • Professional development courses in centralized or regional catalogs • Dedicated YouTube channel and a website	Individual	(DOF, 2019; USICAMM, 2020)
New Zealand	Professional standards for school principals (primary, area, and secondary): • Culture • Pedagogy • Systems • Partnerships and networks	There are two types of evaluations: • An annual school self-review (supported by a Board of Trustees) The Education Review Office conducts an assessment of the school every 3 years, or earlier if development is needed. Their inspection-like procedure is based on six dimensions: • Teaching • Leading and managing • Governing • School culture • Engaging families • Paper-based questionnaires • School visits (including mentoring)	Results form part of the school improvement plans. • Several programmes are on offer	Both	(Nusche et al., 2012; ERO, 2021; Ministry of Education, 2021)
Nicaragua	There are no standards		Two sessions of two weeks each (180 h in total). Topics include: • Education in a national and global context • Pedagogy and leadership • Leadership and school improvement	Both	(Borden, 2002; OEI, 2017)

(Continued)

Country	Standards or criteria for school principals	Evaluation methods and instruments	Relationship with professional development	Accountability at the individual level, the school level or both	Selected references
Paraguay	As part of the new manual for the monitoring and management of educators and educational institutions, school principals are expected to perform in four dimensions: • Pedagogy: efficient and critical management of the national curriculum • Personal and professional development • Administration: efficacy and efficiency in resource management • Social engagement: promotes the communities' participation.	• Paper-based questionnaires • Administrative records • School community surveys	10 modules totaling 1 thousand hours of training. Topics include: • Administration for quality • Educational change and the school principal's role • Technical and pedagogical issues • School organization • Efficient school management • Strategic planning • Human resource management • Educational evaluation • Diploma in school management and leadership	Both	(Borden, 2002; OEI, 2017)
Peru	Framework for good school leader performance. It is organized into two domains, seven competencies and 21 observable indicators. The two domains are as follows. • Institutional management for learning improvement • Pedagogical management for learning improvement.	Entry requirements Centralized • To pass the unique national exam (PUN in Spanish), which includes: • Reading test • Management sample cases • Pedagogical knowledge Decentralized • Professional trajectory • Merits • Professional experience		Individual	(OEI, 2017; Aravena, 2020)
Rwanda	National School Leadership Standards 1. Creating strategic direction for the school 2. Leading learning 3. Leading teaching 4. Managing the school as an organization 5. Working with parents and the wider community	• Written evidence of school improvement plans and achievements. • Records of staff meetings • Student outputs • Records of classroom visits • Evidence of communication with the community and the staff.	CPD Diploma Program in Effective School Leadership; and CPD Certificate Program in Educational Mentorship and Coaching. As part of the CPD Diploma, headteachers complete eight practice-based written assignments and a Portfolio of Evidence. Sit a written assessment and undergo a field visit by trainers to feedback on the assessment tool. The Certificate Program includes two visits, one formative and one summative.	Both	(VVOB, 2019; REB, 2020)

The purpose of this chapter is to provide an overview of school leadership research and policy trends in Latin America. The storyline of our chapter is as follows: globally there is a shared understanding that leadership matters for school improvement, and school leadership development is an important system responsibility. However, outside the Global North the school leadership research base is nascent and uneven. This means that although much school leadership research concludes that context matters, in many regions of the Global South international/borrowed policies and leadership frameworks dominate. In this paper we highlight the following tension in Latin America specifically: there are two trends that are true simultaneously, namely that the knowledge base is thin and uneven across countries *and/but* there is growing interest in school leadership among researchers and policymakers in who leaders are, what they do and with what impact, and how systems recruit, support, and evaluate them.

By reviewing trends in research and policy on school leadership in Latin America this chapter provides readers with a snapshot of the current knowledge base as well as a set of key questions to help explain key conceptual and empirical gaps. This chapter is based on our work originally published in a first-of-its-kind Special Issue on Latin America of *Educational Management Administration and Leadership* (Flessa et al., 2018). That review covered 2000–2016. As we prepared this chapter, we returned to the scholarly databases to see if our original conclusions would hold in the face of new research published between 2016 and 2021. We believe that they do.

Overview of the field of study and its relevance to the region

The study of school administration and management is not new. For example, administrative progressives in the United States, responding to expanded public schooling in the early 20th century, sought to apply the lessons of industrial efficiency to the management of schools and districts. The field of educational administration, focusing on the specialized managerial work that principals as distinct from teachers do, was born. From the start an anchoring conviction was that principals matter both for teachers' work and student achievement, and that the principalship is a profession with special knowledge and skills. Ellwood Cubberley, for example, put it this way almost a hundred years ago:

We are not likely to overestimate the importance of the office of school principal ... The knowledge, insight, tact, skill, and qualities of helpful professional leadership of the principal of the school practically determine the ideals and standards of achievement of both teachers and pupils within the school.

Cubberley (1923, pp. 349–50).

In other words, the current conviction among educators and policymakers that principals matter has a long lineage, and attention to school level leadership, especially in the United States and UK, has been undergoing a renaissance since the late 20th century as both governments (e.g., the National College for School Leadership in the UK) and foundations (e.g., the Wallace Foundation in the US) invested hugely in leadership research and development. For current readers, Cubberley's century-old assertion likely sounds much like the conclusion of Leithwood and colleagues from earlier this century: "School leadership is second only to classroom teaching as an influence on pupil learning" (Leithwood et al., 2008, p. 27). (Or, the "revisited" version: "School leadership has a significant effect on features of the school organization which positively influences the quality of teaching and learning. While moderate in size, this leadership effect is vital to the success of most school improvement efforts" (Leithwood et al., 2020, p. 6)).

Grissom et al. (2021) also "revisit, question, and extend these earlier conclusions to provide new direction for practice, policy, and research in school leadership" (p. xi) and find that "the overall impact of an effective principal can be linked to observable

behaviors. That is, *how* principals approach school leadership directly affects schools' outcomes" (p. xv). Grissom et al. (2021) have provided the most recent rigorous synthesis of 4800 documents on school leadership (in English). Their conclusions are worth quoting in full because they both reaffirm the importance of school leadership as well as redefine the knowledge base on school leadership, mostly from the Global North (p. xviii):

1. Effective principals are at least as important for student achievement as previous reports have concluded—and in fact, their importance may not have been stated strongly enough.
2. Principals have substantively important effects that extend beyond student achievement.
3. Effective principals orient their practice toward instructionally focused interactions with teachers, building a productive school climate, facilitating collaboration and professional learning communities, and strategic personnel and resource management processes.
4. Principals must develop an equity lens, particularly as they are called on to meet the needs of growing numbers of marginalized students.
5. Effective principals are not equitably distributed across schools.
6. Principals are becoming more racially and ethnically diverse, but representation gaps with students are growing, which is concerning, given the payoffs to principal diversity.
7. Research on school principals is highly variable, and the field requires new investment in a rigorous, cohesive body of research.

In short, although there is always more to know and there is always an imperative to strengthen the knowledge base, there is little debate in the English language research literature about the importance of school leadership.

But what of Latin America? As Weinstein (2021) has argued elsewhere, "very little is still known about the people that take on the leadership roles, and even less about how they develop their leadership practices, what their educational and professional motivations are, or how their efforts translate into school improvement" (p. 138). Hallinger (2020) has noted that only 5% of articles in key English language educational administration journals since 1965 have addressed Latin America; indeed, a research scan dating to 1965 showed no publications on school leadership until after 1990.

Our contribution to the knowledge base on school leadership in Latin American was to review almost 400 policy documents and research articles to understand the state of the field. The bilingual English-Spanish research team reviewed materials in both English and Spanish and, for Brazil, in Portuguese. Our conclusion, which we believe still stands, is as follows:

First, we noted that Latin America has come to school leadership as an area of research and policy focus on recently; second, a small set of Latin American countries, led by Chile, accounts for the majority of the school leadership publications in this century, meaning the published record of leadership for most countries is very thin; and, third, in the few places where there are policy efforts to emphasize leadership, their points of reference appear to be Anglo-American leadership concepts and researchers (p. 193).

In the sections that follow we first summarize the trends in educational leadership research that we uncovered in our 2018 review. After that we discuss educational leadership policy trends in the region by foregrounding the questions that the policies seek to answer. We conclude with speculation on the drivers behind the growth, however uneven, of interest in school leadership in Latin America and point to promising areas for development of future research.

Research trends

Our comprehensive review of the school leadership literature observed several trends in the research. In the sections that follow we state those trends and speculate on their meaning.

1. We found that school management research is slightly more common than school leadership research.

As Gunter (2004) and others have noted, there has been a movement away from locating the work of principals under the labels of administration/management, toward labeling the work of school principals as leadership. (As a small illustration—the home program for the lead author is now called "Educational Leadership and Policy" not "Educational Administration.") But it is certainly possible that, given the overall newness of school level leadership research in Latin America, that this movement away from administration and toward leadership is only just underway. It is also possible that the emphasis on management is an accurate reflection of prevailing ideas about school level decision making in Latin America.

2. References to school leaders and management arise primarily within the context of school change and reform.

There are two interesting aspects to this finding. First, given that the work of school level leaders, particularly principals, is important for achieving a wide range of policy priorities because principals influence the conditions of under which teachers implement (or not) policy change and reform, it stands to reason that leadership research would center reform/s. Second, the emphasis on leaders-in-a-context-of-reform suggest, perhaps worrisomely, that leaders and leadership remain an under-examined black box in their own right.

3. Studies that focus directly on leadership are often case studies of leadership characteristics, practices and problems encountered by principals and focus on leadership frameworks such as “transformational” or “instructional” leadership. Leadership teams and forms of distributed leadership are minimally examined.

Research on distributed leadership has undoubtedly been one of the most influential bodies of research in the English language school leadership literature for decades, prompting special issues of key journals, edited volumes, and texts for both academic and professional audiences, and the interest continues (see e.g., [Supovitz et al., 2019](#)). The concept is not similarly evident in the literature we examined from Latin America. We found this absence interesting for several reasons. First, in many school systems, school level leadership falls to “equipos directivos”—broadly, “leadership teams.” These teams can include principals, other administrators responsible for student conduct/discipline or administrators responsible for what in English would probably be considered “school climate” but more accurately translates to “getting-alongness.” In Chile schools have the interesting figure of the “jefe pedagógico” or pedagogical chief, an administrator responsible for working with teachers on curriculum, teaching, and learning; there is a similar figure in Brazil called the “pedagogical coordinator.” These teams are formally defined in some countries (e.g., Chile, Ecuador, Argentina) and undefined in others (e.g., Peru and Colombia). In short, although it is next to impossible to generalize about the region, there are numerous on-the-ground examples of shared or distributed leadership in many schools in Latin America. The fact that analysis examining the range of how and with what impact school level leadership is shared is in short supply perhaps derives from the simultaneous reality that policy and legislation are still fundamentally organized around a vision of the solitary school leader sitting atop the school hierarchy.

4. Latin America is diverse in terms of research production.

There are prolific countries like Chile, Brazil, Mexico (with all three participating in OECD’s TALIS study). There is less published research from Argentina, Costa Rica, Cuba, Colombia or Venezuela. Although we initially found very little from Ecuador, Bolivia, Panama, when we revisited this question to prepare this chapter we encountered several theses on “*gestión educativa*” (which roughly translated to “educational administration”). Although this work has not yet made its way into the peer reviewed or gray literatures it is possible that more work on school leadership—for example from Ecuador—will emerge from these theses.

Importantly, most of the research we encountered were small-scale studies. With the exception of Chile, with its well-established mechanisms for collection of educational statistics, we encountered very little work showing baseline demographic data (age, gender, educational qualifications) for school principals, little work linking school-level leadership to system-level priorities, little systematic research on leadership pathways. In short, even where research on school level leadership exists, we are left with gaps in our understanding of how leadership work at the school level reflects (or doesn’t) the priorities of educational systems in this populous and diverse region.

Another complementary way of viewing this issue is with respect to international tests that, although their focus is not on leadership, also collect some information on principals, as is the case of TALIS (the “Teaching and Learning International Survey” from UNESCO) or LLECE (“El Laboratorio Latinoamericano de Evaluación de la Calidad de la Educación,” part of the “Oficina Regional de Educación para América Latina y el Caribe”, UNESCO). In some of these tests very few countries in the region participate (such as the case of TALIS) and in others (such as the case of LLECE) the information on leadership is barely analyzed from a research perspective. Meaning: regional cross-national data are both limited and, where they exist at all, under analyzed.

Policy trends

Are principals professionals? Are principals educators?

[Murillo and Román \(2013\)](#) found that about 40% of principals in their 17-country study had a second job in a school. This striking finding is potentially indicative of an important open question in Latin America about whether the principalship is a *profession*, with specialized and explicit preparation, credentialing, recruitment, and selection, and unique responsibilities, or whether the principalship is only an occupation, such as in many rural schools where teachers maybe required to take on additional mainly administrative tasks outside their classroom teaching. In our 2018 paper we concluded that “We can safely conclude that the degree to which principalship has been professionalized with specific managerial and instructional responsibilities and expertise, and standards for selection into the profession, varies greatly in Latin America” (p. 192).

Another open question is the degree to which education systems in Latin America, which range from the highly centralized (for example Cuba) to the highly localized (for example, Argentina) to the highly privatized (for example Chile), share any common perspective on what the role of the school level leader should be. Is the principal’s role best understood as administering the policy priorities of a central government ministry or as entrepreneurially solving problems according to local needs or competition for enrollment? All of the countries we examined for our 2018 paper have school leadership roles (the principalship) explicitly defined in law and regulation; those regulations typically stipulate managerial rather than pedagogical responsibilities.

Countries across the region have answered a core question about school leaders’ identity—is a school principal an educator?—differently. Most but not all countries require classroom teaching experience, and the corresponding required educational background, to become a principal. But this requirement is by no means universal. As with other parts of the Global South school principals are sometimes chosen by patronage (e.g., by a political head of local government with responsibility for schooling) where relationship to a politician or political party is more important than other qualifications (see for example [Adelman, Lemos and Teodorovicz, 2019](#); [Donoso-Díaz et al., 2019](#)). On the other hand, sometimes school principals with no background in education

are chosen via transparent civil-service-style competition, perhaps linked to ideas that schools are businesses and “strong leadership” is therefore more likely to be found outside the education sector than within.

Similarly, the processes for hiring school leaders vary greatly across Latin America. For example,

Argentina, Colombia, Ecuador, Mexico and Peru use a combination of merit-based competitions and/or examinations. Costa Rica and Chile are attempting to increase the standardization of processes by using merit-based selection assessed by central government agencies. Given the limited autonomy that principals in Latin America seem to have, we were surprised to find great diversity in the degree to which their hiring was managed centrally or are decentralized. (We expected to see mostly centralized hiring.) In Argentina local provinces regulate the eligibility process and there is no role for central government (an illustration of how many decisions in Argentina's federal system are made at the provincial level); in Chile and Peru there is a shared governance approach where the local level has the final decision; in Ecuador a school committee, made up of parents, students and teachers, participates in assessing the school management plan presented by the candidate; and in Costa Rica, Colombia and Mexico there is a fully centralized process whereby candidates are scored by judges to decide about the final appointment.

Flessa et al. (2018, pp. 191–192).

The contract for successful candidates for the school directorship varies in the region. For example, in Argentina and Colombia the number of years for a principal contract are undefined/indefinite; in Chile the contract is for five years (renewable); in Ecuador and Peru the contract is for four (renewable).

How are principals prepared for the job?

Whereas policy and research in the US, which dominates the English-language literature base, focuses a great deal on the *preparation* of school leaders, often via specialized, university-based credential programs, the policy infrastructure in Latin America is sufficiently different that to talk about “preparation” makes less sense than to talk about *formación*. To provide concrete examples, Argentina and Ecuador require some form of preservice preparation but Chile, Colombia, and Peru do not. Meaning: there is neither a policy or research base focused exclusively on preservice preparation, and, across the region the better way to understand the training that principals receive is to think about in-service professional development. There is certainly no lack of professional learning for school leaders across the region. Weinstein et al. (2018) have discouragingly found, however, that such learning opportunities for principals have little *impact* on how teachers view principals’ contribution to the professional development and collaborative work of teachers.

One way to explain this perhaps counterintuitive finding is to point out that governments have typically not invested in systematic understanding of the leadership pathway or where preparation or professional development would fit in that. And although we saw some evidence of public professional development, most in-service learning is self-funded by the leadership aspirant for programs in the private sector where oversight, alignment to state policy priorities, and quality control are minimal.

Growing interest in credentials raises the question of where knowledge resides to do this professional preparation and development well. Is it in systems, in ministries of education, in university faculties of education, in professional associations or teachers’ unions? If policy in the region were to move in the direction of more explicit requirements for leadership preparation before taking on the role of principalship, just who should provide this preparation, and how would policymakers know that this was a wise investment?

Another fundamental question that underlies any discussion of *pathways for leadership development* must be: who are school leaders? Frequently, “school leader” is used interchangeably with “principal.” But a comprehensive vision of leadership development, including the articulation of a leadership pathway, would need to consider that much of the work of school leadership is also done by teachers (“middle leaders” in roles like department chairs, see Gurr (2019)) as well as management *teams* in schools. If policymakers want investments in school level leadership to show results, such investments would need to recognize who in fact is doing the work of school leading—and that would include more than principal alone.

Finally, the articulation of a coherent leadership pipeline, including preparation and professional development expectations, must also identify—and then rectify—the obstacles, whether intentional or not, that inequitably, often on the basis of gender, ethnicity, or sexuality, exclude leadership aspirants from the role. Research that provides baseline data of school leaders’ demographic characteristics as a way of identifying systematic patterns of exclusion is a necessary but frequently missing in the region.

Leadership frameworks: international benchmarking at the expense of local context?

There is also a further question about preparation that policymakers must contend with: credentialing and preparation initiatives are preparing school leaders *to do what*? At the same time that expectations of the job are changing, so too must the expectations of how preparation programs should be organized and oriented. One possible anchor for preparation programs would be the development of leadership standards or frameworks. Chile has adopted a leadership framework (“El Marco para la Buena Dirección y el Liderazgo Escolar”) with many parallels to the Ontario (Canada) Leadership Framework (OLF) (Leithwood, 2012). The Chilean framework focuses on building a shared strategic vision, developing professional capacities, leading the teaching and learning process, building school climate and community, and effective school management to meet institutional goals. The Ontario framework uses similar categories of leadership work: setting goals, aligning resources with priorities, promoting collaborative learning

cultures, using data, and engaging in courageous conversations. The OLF and the Chilean framework have influenced the development of similar frameworks in other countries in Latin America, such as Peru and Ecuador. That said, leadership standards and frameworks are not universal; Argentina, for example, has none. In general, frameworks emphasize leadership for school improvement and pedagogical leadership. Frameworks have positive potential for creating common language in the education sector about what leadership is and what leaders do; standards express a system's priorities to which leadership preparation, recruitment, selection, and evaluation can be benchmarked. Frameworks and standards represent attempts to organize public policies, and this organization can be especially valuable to systems seeking coherence in the early phases of investment in school leadership.

That said, the body of research to illustrate that frameworks change leaders' behavior in Latin America is thin, and the question remains open whether frameworks sufficiently consider local context. In our research and policy scan of school leadership in Latin America we concluded, much like [Moorosi and Bush \(2019\)](#) observed in their work on school leadership development in Africa, that although there is near universal agreement that context matters for school leadership, imported frameworks for understanding, researching, developing, and assessing leadership dominate the field. [Hallinger \(2018\)](#) has written persuasively about this problem, arguing that "research syntheses which report what successful leaders do have tended to strip away the 'context specificity' needed to help practitioners understand how to apply findings in different schools. Metaphorically, by placing the spotlight on leadership, researchers have unwittingly relegated the context of leadership to the shadows" (p. 6). Interestingly, Hallinger discusses school contexts—plural—as influencing the work of school leaders: institutional, community, socio-cultural, political, economic, and school improvement. All of these contexts vary across this diverse region and so too should research about leadership. However, the prevailing trends in the literature are, first, that there is limited research and second, that the research that does exist relies on imported frameworks, suggesting that context is neglected in research analyses and recommendations.

This is not a generalized critique of frameworks but instead a doubt about their application in Latin America. The question of context is persistent and also inevitable. One reason we have found [Hallinger's \(2018\)](#) definition of *various* contexts to be useful is because it suggests that any authors (like us!) making arguments about "context-informed" leadership should use the word context more precisely. There's not one context, there are many—and deciding how frameworks should reflect them requires trade-offs between scope and specificity.

One concrete illustration of a realm of leadership overlooked when importing frameworks to Latin America is the leadership obligation in many competition/market-based education systems to recruit students. Student enrollments determine school budgets. This skill set is absolutely necessary for survival. [Carmen Montecinos et al. \(2015\)](#) and [Galdames et al. \(2018\)](#) have used "triple accountability" analyses to study this kind of competitive/market phenomenon but we're unaware of any frameworks or standards in Latin America that include this realm of work. For school leaders in some Latin American school systems this is the most pressing, indeed most organizationally existential, leadership obligation. It falls outside of any leadership framework we're aware of but clearly matters for defining the scope and practice of school leadership in Latin America.

We return to the question of context in our recommendations for future research.

Policy drivers and areas for future research

Given the still nascent nature of school leadership research and policy in the region, plus the vast diversity of the region's education systems and schools, uncovering a single underlying explanation for research and policy trends is not possible. Instead, we "tested" a range of alternative explanations in an attempt to better understand the policy drivers and where they come from.

Policy drivers

1. Are differences in the region explained by variations in centralization and decentralization?

School systems in the region vary in their degree of centralization; policy priorities in different countries take different approaches to how tightly coupled school and educator actions must be to rules and directions set within ministries of education. In examining our research and policy materials we wondered if greater centralization meant that school level leaders were less important, perhaps because a centralization logic would frame school leaders primarily as bureaucrats responsible for administering centralized policies. Alternately, we wondered if decentralized systems, where policy goals may be set centrally but the pathway to reaching them is left to the local level, might see greater investment in school level leaders who could guide schools' actions in response to local contexts. We found neither link in our data. Some more decentralized countries did *not* seem to focus on leadership, and others more centralized did. So, although we are confident that the degree of system centralization does affect principals' working conditions and responsibilities, it does not seem to be a primary driver of research or policy.

2. How powerful is policy borrowing in shaping the direction of school leadership development in the region?

We saw plenty of evidence of policy adoption in the region and plenty of work drawing from the same English language UK/US resources. We are unable from our review of the literature to determine what *motivated* this policy borrowing—institutional isomorphism, harmonization, response to incentives from global funding agencies, benchmarking. However, while policy adoption is clearly a phenomenon worth greater investigation, we do not conclude that it is the sole explanation for leadership development trends in the region. Other factors clearly play a role: local school and system needs; resources available for investment in this area; system coherence and strength; capacity to make change.

3. Does the amount of leadership investment in a particular country in the region somehow reflect the country's infrastructure or "developmental" readiness for leadership? Does leadership come after other priorities (e.g., universal primary education, investment in hard infrastructure like buildings or textbooks)?

The evidence from our review does not point in this direction. As we concluded in 2018, "we believe that a full explanation of the links between reform policies, school leadership, and school improvement in Latin America requires more research" (Flessa et al., 2018, p. 196).

4. Is it possible the investments in leadership are explainable as a form of technocratic problem-solving?

If one views national policy making as rational, one might conclude that policy makers see leadership as one of the best ways to solve problems such as improving education quality that have not yet been solved. There is research showing that school leadership can improve education quality, so perhaps this is the reason—or at least an important part of the reason.

5. Does the embrace of school leadership in the region mostly reflect a prevailing neoliberal orientation to policymaking, where accountability and resource scarcity are both reinforced by a focus on principals rather than, say, teachers?

We saw evidence of the link between school leadership and school accountability in materials from Chile and Brazil; principals are seen as one important lever for school level improvement aligned with state policy goals. However, there is more to neoliberalism than accountability policy; for example, one would expect to see budgetary austerity as well. And while Chile has one of the most extensive testing and school accountability regimes in the world as well as an overall privatization approach to schooling, it has also *increased* not decreased public investment in public schooling in recent years. Investments in school leadership may indeed reflect the impact of neoliberal logics among policymakers, but the literature thus far does not provide sufficient evidence for that conclusion.

A related point: important actors in the region are private foundations linked to large companies or economic groups. These actors often have great confidence in the ability of an organization's senior managers (such as CEOs) to motivate and lead changes and affect results. There is a simile here between the company and the school. In fact, business managers themselves feel that they have a lot to teach school managers in terms of leadership and management. A clear example of this impact on managers of this business aspect are the training programs that have been developed by business foundations, as has happened in Colombia (Rectores Líderes Transformadores promoted by Fundación Empresarios por la Educación).

Areas for future research

Our recommendations for future research reflect two emphases, namely to deepen the knowledge base in some areas and to initiate research in areas where we found little or none.

As we have noted, there is a nascent knowledge base concerned with what broadly could be considered leadership pipelines: the machinery of recruitment, selection, preparation and professional development, and evaluation of school leaders. This work can certainly be deepened by work that compares the various approaches—and their impacts—in the region. Such work will also require baseline data of who school leaders are and how they are prepared for the job.

There are several areas where there is minimal research, and these are true gaps in the knowledge base on school leadership in Latin America.

First, we found surprisingly little school leadership research focused on questions of equity of learning opportunity, and no work focused on leadership in or for Indigenous communities. This seems a striking oversight, given the realities of stark inequalities across the region, inequalities that have been highlighted by the impact of COVID-19 and the historic out-migration from Venezuela in recent years.

Second, research examining how school leaders work with teachers' unions and how school leaders navigate social and labor protests in the public sector are needed. Such research would not only be timely it would also provide a greater understanding of where school leadership fits within different political contexts. When the role of the state in education is contested, how do school leaders understand and enact their roles?

Third, we believe that there is space to develop a research program that examines how concepts prevalent in the English-language research literature—for example, "instructional leadership"—emerge (or don't) in Latin American schools, and why. In what ways has the political history of the region informed the way that concepts like "strong leadership" are understood? Such research would not only provide insights about the applicability of the concepts to schooling in Latin America, they would also provide insights into the concepts themselves and their limitations for English language and other audiences.

Fourth, there is space to develop research on leadership teams and leadership positions beyond the principalship, given the evidence of various school leadership roles and teams utilized in Latin American schools. This would build upon but not be the same as research into distributed leadership prevalent in the English-speaking EDLM literature.

Fifth, the topic of leadership and management in private schools and their differences with public ones is also important. The privatization of education is no longer just a Chilean issue but is advancing strongly in other countries or regions (such as Peru, Buenos Aires, etc.) and promises to be a major trend. To date however, educational policies and research tend to focus on public establishments. Therefore, considering the school system as a whole and not just one part is a requirement for future research.

Finally, we believe future research on the topic of school leaders' "sensemaking" would make valuable contributions to the knowledge base. It would contribute to both policy and practice by highlighting how school leaders, especially "*directores*" (principals) navigate the potentially contradictory incentives of the job. There is a baseline comparative education question here: which is

more significant, that principals in different systems understand their jobs differently, or that they understand them in similar ways? Is a principal a principal regardless of system, or does the system within which they work make them very different educational figures? Research on leaders' sensemaking in Latin American schools may in fact be the key body of work necessary to synthesize what is known about the particularities of local context and to apply that knowledge to broader policies like leadership frameworks. Taken together these different lines of research would build a rich knowledge base on educational leadership in Latin America and, within the right policy window, inform the development of the next generation of school leaders in the region.

In conclusion, in the published research and policy literature there is evidence of a growing interest in school leadership in Latin America. This nascent knowledge base provides valuable insights into the potential and the pitfalls of leadership development in the region and also indicates for a global scholarly audience which concepts have the most salience and which are mismatched to local context.

The uneven rise of China	476
The complexity of educational leadership in China	478
What shapes educational leadership in China?	479
Learning from China?	480
Acknowledgment	481
References	481

The past 10 years have witnessed the growth of increasingly diverse and sophisticated literature on educational leadership in non-Western societies, particularly in Asia (e.g., Hallinger and Bryant, 2013; Liu et al., 2016; Qian and Walker, 2013, 2020; Walker and Qian, 2012, 2018a). China has contributed the largest corpus of published research on educational leadership in Asia (Dimmock, 2020; Hallinger and Bryant, 2013). Despite the quantitative expansion of research, there remains a noticeable imbalance between research generated in diverse politico-socio-cultural settings and that produced in more established societies. Dimmock (2020) holds that this curtails authentic knowledge production and transfer. A cross-culturally valid knowledge base with global relevance is yet to reach maturity.

While preparing this article we, like the rest of the world, were confronted by an unprecedented crisis which carried with it not only widespread hardship and sadness but also new levels of mistrust between nation-states. The impact of COVID-19 expanded the already festering rift between China and the West. In the longer term, the tension between Chinese and Western values, as reflected in politics, business and even research present a major challenge to the social sciences as they strive to develop a coherent knowledge base that reflects the global diversity of policies and practices. Be it in a relatively minor way, this challenge unavoidably touches understanding of and research into education including, as is our interest, educational leadership. It is therefore timely to review the development of educational leadership in China and examine this within an international frame. It is through such work that divisions of understanding can be pragmatically addressed. By exploring what educational leadership in China looks like and, as importantly, why this is so, we attempt to address how locally interpreted narratives give force to universal categories and how universal categories give force to local narratives (Stambeck, 2003, p. 157).

The purpose of the chapter is to briefly review what recent research tells us about educational leadership in China and to analyze the major contextual factors that shape its enactment. By doing this, we comment on why there appears a discrepancy between evidence-based understanding of Chinese education leadership and the stereotypical images widely presented in Western discourse. Drawing on this discussion we provide several insights into educational leadership in China. We draw evidence from our research conducted over the past decade (e.g., Qian and Walker, 2013; Qian et al., 2016; Walker and Qian, 2015, 2018a), several international comparative reports (e.g., Jensen et al., 2016; Liang et al., 2016; Tucker, 2013) and the increasing corpus of empirical studies being produced by other Chinese researchers (e.g., Liu and Hallinger, 2020; Yin et al., 2013; Zheng et al., 2019). It should be noted from the outset that China is a huge and diverse country. As in all countries, there are significant differences between regions in terms of resource availability, socio-economic-status, ethnic composition, education development, curriculum structures, policy implementation and political dynamics, to name just some. These and other contextual features impact the shape and practice of school leadership at all levels. This makes it impractical to capture a comprehensive picture of either the shape or impact of school leadership across the country. We therefore aim, within space limitations, at a general level of understanding using the major literature produced over the last decade and that most pertinent to the purpose of the article.

The uneven rise of China

Over the past decade, China has been firmly positioned as a key “reference society” (Schriewer and Martinez, 2004) due to the international attention flowing in the wake of the outstanding performance of Shanghai students on the Program for International Student Assessment (PISA) 2009 (OECD, 2010). Given its debutant status, Shanghai’s PISA results were considered outstanding. It outperformed other countries in mathematics, science and reading by a clear margin (OECD, 2010). When Shanghai participated in PISA for the second time, in 2012, it again topped the league table in all three subjects (OECD, 2013). When more provinces joined PISA in 2015 and 2018, overall student performance remained around the top on the league tables. The success went beyond academic performance; students also tended to “perform well regardless of their own background or the schools they attend[ed]” (OECD, 2010, p. 9). For example, the 2009 PISA results revealed that 76% of disadvantaged students in the Shanghai sample were considered “resilient”; that is, despite being classified as “disadvantaged” – defined by placement in the bottom quartile in terms of the distribution of socioeconomic status (SES) – they scored in the top quartile of students from all countries from similar

backgrounds. In the foreword to the 2009 volumes analyzing the PISA results, Shanghai was mentioned by name as the education system “that [has] been able to secure strong and equitable learning outcomes” (OECD, 2010, p. 3).

The afterglow of the PISA success cast Shanghai as an international model of academic success. The newly-founded visibility triggered a mixture of international admiration and intense debate. Western societies such as the US, UK and Australia began “looking East” in an attempt to identify the “formulas” driving China’s academic success (Seller and Lingard, 2013). For example, various books and international comparative reports released over the past decade either focused singularly on Shanghai or studied China in tandem with other high-performing societies. These include to name a few, a US publication that told stories of successful education performers internationally, entitled *Surpassing Shanghai* (Tucker, 2013); the book *Learning from Shanghai* written by a Singaporean researcher (Tan, 2013); and a World Bank report called *How Shanghai Does It* (Liang et al., 2016). Moreover, in addition to synthesizing and spreading “Shanghai lessons” in publications, different initiatives were set in place to mirror their practices in schools and classrooms in Western societies. For example, the *England-Shanghai Mathematics Teacher Exchange Program* instituted in 2014 aimed to promote the Shanghai method of Maths teaching in UK schools (China Daily, 2019). With the support of Peabody College of Vanderbilt University and East China Normal University in Shanghai, the State of Tennessee introduced the Shanghai model of teacher peer observation and feedback into their schools, naming it the TPEG (Teacher Peer Excellence Group) (Cravens et al., 2017).

However, the quite remarkable PISA success must be viewed within the broader context of Chinese education, such success does not hold for the entirety of China - major cities such as Shanghai and Beijing are not indicative of the country as a whole. China is a labyrinth of contextual diversity which interacts in various ways to influence school success. Perhaps the starkest differences in educational opportunity and school success are between developed urban (e.g., Shanghai) and underdeveloped rural (e.g., Guizhou) settings. They are also apparent in the provision of education for ethnic minorities and for the children of migrant workers in large urban centers (Qian and Walker, 2015). Differences between urban and rural schools endure for a number of reasons. The most telling of these is access to adequate resources. As we pointed out in an earlier study, “Principals working in cities such as Beijing and Shanghai can harness many more resources than those from rural regions in West China” (Walker and Qian, 2015, p. 484). The lack of resources plays out in rural schools in many ways. These include constant difficulty in recruiting and retaining quality teachers, time required to make the right connections to secure resources, and a lack of adequate professional development.

Government recognition of the inequities between urban and rural schools has spurred a raft of policies intended to address the situation. For example, in an effort to increase teacher quality and retention in rural schools the government instituted the Special-Position Teacher Program (*Tegang Jiaoshi*) in 2016 and the Rural Teachers’ Support Program in 2015 (Liu and Hallinger, 2017). Both sought to alleviate poverty and “improve the capacity of rural school leaders and teachers (Liu and Hallinger, 2017, p. 2). Although such policies are beginning to see glimpses of success, issues such as high drop-out rates, teacher morale, poor attendance, broken families and teachers’ preference to work in cities where the pay is better continue to typify the rural landscape (e.g., Ye and Christiansen, 2009) and consume huge amounts of principals’ time; time which urban principals use to devote to instructional matters. In summary, the much-heralded success of China on international competitive assessments, while impressive, relies on a number of large urban centers and there remains substantial variation in performance across different contexts, most notably between rural and urban centers, and this impacts the exercise of school leadership. Such variation is widely recognized in China and forms part of an ongoing dialog on the future of education in the country.

The emergence of China as an educational exemplar aroused debate and controversy both within and outside of China. For many years, China had seen herself as a learner and follower of Western theories and practices. For example, in the postscript of the Chinese version of *Surpassing Shanghai*, the translator, Chinese scholar Ke Zheng, expressed puzzlement about China becoming a new world role model for education.

How have we become the “idol” of our “idols”?... We are used to thinking that we need to learn advanced educational theories and practices from the Western societies. What has happened to this world? Our idols (Western societies) start to talk about how to learn from us? (Ke, 2013, p. 215).

Chinese American scholar Prof. Zhao Yong expressed more than puzzlement when he warned that if the West were to import Chinese educational practices, it risked “drinking poison to quench one’s thirst” because of the potentially disastrous consequences of unthinking emulation which had long been recognized in China itself (Zhao, 2017). For example, the Chinese education system was perceived as being so rigid that it could do little to promote creativity or applied problem-solving.

Putting the debates aside, the ongoing desire of Western societies to learn from China has had the effect of prompting renewed reflection on the purpose, nature and workings of the education system and of individual schools within China itself. Nationally, the central government has called on all sectors of society to “tell China Stories” (*jiang zhongguo gushi*), that is, to communicate and disseminate what is happening in China to the rest of the world. This call is echoed in the field of education where participants are encouraged to commit more effort to promote Chinese voices broadly around the world (Cui, 2017).

The policy appears to be having the desired effect in different areas. For example, a recent review showed a marked quantitative increase in the number of articles about the principalship in China in international journals in the field since 2008. Between 1998 and 2007 there were only 17 articles in the area published in major English language educational leadership journals; between 2008 and 2016, 48 papers were published in the area in the same journals (Walker and Qian, 2018a). An increasing number of

indigenous scholars have taken a more contextual view in their work and become more openly questioning about what happens in Chinese schools – commenting on both the positive and negative aspects. Their insights contribute much to the international knowledge base of what educational leaders in China do and why they do what they do.

The complexity of educational leadership in China

To outsiders, many aspects of education in China appear complex and difficult to understand. Government and education systems are centralized and generally purposefully elitist and have been so for hundreds of years (Zhao and Qiu, 2010). To some extent, China maintains a stratified school system (Cheng, 2011). Resources tend to be allocated based on the rank of the school (Walker and Qian, 2018b) and differ quite markedly between rural and urban schools. Despite widespread criticism, Gaokao, or the University Entrance Examination, still dominates the scene (Harris et al., 2009; Sargent, 2011). That is, schools must perform well in examinations if they are to be ranked as successful, regardless of whether the ranking is official or unofficial (Walker and Qian, 2012). Principals are selected, appointed and appraised by the local government agency and held tightly accountable to their superiors (Qian and Walker, 2014; Zheng et al., 2013). Teachers are also placed into different categories through a hierarchical teacher ranking system (Jensen et al., 2016; Walker and Qian, 2018b).

The factors listed above are often framed as hindering the exercise of successful school leadership, leading to the question of how school leaders in such a context can exert their roles in ways which contribute to student success. Multiple empirical studies have sought to provide contextualized understandings of the practices of educational leaders in China (e.g., Liu and Hallinger, 2017; Qian and Walker, 2013, 2020; Qian et al., 2017; Walker and Qian, 2011, 2018a, 2020). These studies have helped, at least partially, to unravel the complexities and nuances that characterize the context and practices of educational leadership in China. Several propositions capture some of the major features of educational leadership in China:

- *Chinese school leaders engage closely with teaching and learning and have detailed knowledge of classroom practice.* In contrast with much western literature which suggests that principals spend only a fraction of their time on instructional issues (Murphy et al., 2016), Chinese school leaders dedicate much more substantial time to teaching and learning and maintain high levels of visibility in classrooms. Leaders' knowledge of teaching and learning informs the establishment and operation of active structures, such as teacher collaboration, that are designed to support effective instruction (Goddard et al., 2015).
- *School leaders must meet the dual expectations of improved student exam results and holistic student development; this presents them an enduring workplace tension.* The most common way for leaders to cope with the tensions flowing from the reform environment is to speak the educational languages of different systems and actors (Qian et al., 2017). In the long run, it will continue to be a bedeviling task to strike a balance between the traditional metrics of successful student learning and the imported education policies that promote student-centredness and student holistic development.
- *A set of centrally-defined organizational routines in Chinese schools facilitates instructional leadership, but school leaders still play a key role to operationalize and enrich these routines.* Routines are an important element of a school's educational infrastructure (Cohen et al., 2018) that support and coordinate instruction, maintain instructional quality and enable instructional improvement. Along with centrally mandated routines, leaders' adoption of newer practices, such as organizing school-based research and granting teachers honorable titles, has also fostered new organizational routines in Chinese schools.
- *While principals oversee school-wide improvement activities, leadership is distributed across the school leadership team and expert teachers.* A wide range of individuals, with or without formal titles, share leadership responsibilities, such as monitoring instructional activities, modeling teaching and mentoring peers. The distribution of leadership is normally designated top-down by the principal and plugged into formal and/or informal hierarchies. Regardless of the mode of distribution, as Tucker (2014) has observed, the system allows teachers (mainly those recognized as *backbone* or famous teachers) to lead the process of improving curriculum and teaching methods and to work together as a team.
- *School leaders have expanding autonomy to make school plans, design school curriculum, and develop teachers while also being aware of the limitations and constraints of their authority.* For example, they were promised autonomy to recruit teachers, but their actual ability to do so was circumscribed by the national policy of "*bianzhi*" (teacher's posts), that is, a cap on the number of teaching posts assigned to each school by the government. They had the autonomy to design a school-based curriculum, but this only accounted for a small portion of the whole curriculum, this is particularly so in rural provinces.
- *A big part of school leaders' culture-building work is modeling their focus on learning and showing high support for teacher learning.* Only when schools and leaders demonstrate they value learning through investing time and effort will teachers be convinced that their input is welcome (Bryk et al., 2010; Louis et al., 2010). Chinese school leaders generally demonstrate high levels of support for and participation in teacher professional learning.
- *School leaders devote considerable organizational resources to building harmonious relationships and team spirit.* They display a high level of paternalistic leadership, that is, their role is akin to that of a parent in a Chinese family. They care for the teachers' livelihood and social-emotional well-being (Chen and Lee, 2008). They are highly responsive to the dependency needs of teachers. Principals understand that authority alone cannot guarantee teachers' support and trust (Walker and Qian, 2018a). They need to gain legitimacy by demonstrating expert knowledge in teaching and learning and combining sincerity with benevolence.
- *Among various instructional improvement strategies, Chinese school leaders place a high priority on developing teacher capacity and creating a supportive teacher learning environment.* Principals see quality teachers as the most valuable resource and provide impressive

support for teachers' on-the-job learning. This finding supports Robinson and her colleagues' (2008) synthesis of international research which showed that leaders promoting and participating in teacher professional development makes more of a difference than any other aspect of leadership in terms of the link with student outcomes.

- *Chinese school leaders are increasingly expected to broker and shape partnerships or networks across local communities; principals from weaker network schools are expected to be effective learners and change agents in their schools.* This systemwide policy trend relies on leveraging the resources of better-performing schools to support lower-performing schools. As such, it enables schools to run joint teacher development activities and share human and teaching resources. Consequently, this emerging "system leadership" trend (Higham et al., 2009) also raises expectations of principals to develop partnerships, to cooperate with their principal peers and to design more school-specific instructional improvement strategies.

In sum, a complex mix of leadership practices defines school principalship in China, and these can come together in different ways depending on the context within which leadership is exercised. On the one hand, their work environment is highly political - they must be conscious of their role as state employees and their accountability to and dependence on various government agencies. On the other hand, there are strong professional expectations of school principals from the system, teachers and school communities (Qian, 2018; Walker and Qian, 2018a,b). Research then seems to depict a different image of educational leadership in China from the stereotypical picture painted in the traditional Western discourse, which tends to view Chinese leaders as autocratic, hierarchical, and formal (House et al., 2004).

It is not our intention to romanticize education in China or to discount the myriad of serious issues and problems currently active in the country, we have already commented on the discrepancies in educational quality and equity between rural and urban provinces. We therefore suggest that what is judged as "good" or "bad" is relative to changing circumstances or the conditions surrounding them. This is well illustrated in a Chinese proverb *Fortune and misfortune are two buckets in a well* (*fu xi huo suo fu, huo xi fu suo yi*), which holds that every event, every condition, every bit is part of a larger whole. Different buckets dipped into the same well can reel up quite different loads, looking into one bucket risks presenting an incomplete representation (Walker and Qian, 2018b). For example, when governments are strong and directive in terms of curriculum frameworks and pedagogy, another bucket in the same well is that strong governments can easily mobilize huge amounts of monetary and personnel resources to organize cross-school and even cross-provincial teacher development programmes to promote teacher learning (Walker and Qian, 2018b, 2020). This intense and large-scale teacher learning has often been cited as critical to success (Jensen et al., 2016).

What shapes educational leadership in China?

Many different influences shape educational leadership in China. If we focus too closely on key facets of the system only, we risk ignoring that the success (or otherwise) of these particular factors is made possible only by other system features (Tucker, 2014). Whereas we don't claim these as the only contextual factors, the following three features appear key when explaining the enactment of Chinese school leadership.

- Some cultural scripts underpinning the "right" leadership as perceived by leaders and followers
- Interaction and multifarious linkages between imported Western educational policies and traditional Chinese culture
- A simultaneous push-pull effect exerted by some contextual factors

These contextual features are further elaborated below.

Feature 1: Some deep structures continue to shape school leadership and preferred leadership styles in China. For 2000 years, the ancient education system was built around the Civil Service Examination system (Gu, 1981; Mao, 1984). Confucianism underpins Chinese perceptions of the purpose of education; learning has been unambiguously connected with passing exams to bring glory to "families and ancestors" (Gu, 2006, p. 173). The learning strategies were based on repetition and memorization as in Confucian philosophy, repetition is perceived as a necessary method for deep understanding and the production of meaning (Bowden et al., 2015). Therefore, and regardless of their location, school leaders today remain caught in the tensions and conflicts arising from the lingering impact of the traditional emphasis on examinations.

Traditional expectations also set a very high bar for Chinese leaders, one replete with tension. For example, the culture reveres hierarchy but expects leaders to be responsive to the needs of followers. There is also a consensus that hierarchy and distinction should be based on some kind of merit, whether it is related to morality, competence or actual performance (Walker and Qian, 2018a). Furthermore, this merit should be achieved by individuals rather than ascribed to them through inheritance, such as birth, class or other social categories (Parsons and Shils, 1951). In short, authority is expected to combine both elitism and sympathy (Pye, 1991). Mirroring the prototype of the Chinese family, the Chinese leader is often portrayed as the father (Farh et al., 2008). As the head of the family, the father's role is to rule benevolently and justly. The other family members are expected to be obedient and loyal to the head of the family (Fu and Tsui, 2003). Similarly, the leader of an organization is expected to provide guidance, protection, nurture and care for subordinates; the subordinate, in return, is normally required to be loyal and deferential to the superior (Aycan, 2006).

Feature 2: Imported Western education policies and leadership philosophies have interacted and intertwined with traditional Chinese culture to shape leadership and organizational behaviors in schools. China is making enormous strides in education and appears committed to a path of constant improvement. This did not happen overnight - the last 30 years has witnessed gradual improvement in this area.

In the 1970s and 1980s, the push was to expand access to schools for all children. In the 1990s, the focus shifted to improving quality. A curriculum reform was piloted in Shanghai and later spread with various degrees of success around the country. There was also a major emphasis on upgrading the teaching force and trying to reduce examination pressure (Tucker, 2014). Over the past decade, improving quality and enhancing equity has become the dual goals of educational development (Ministry of Education, 2010).

Under the banner of Quality Education (*suzhi jiaoyu*), China has strived to move away from examination-oriented and teacher-centered traditions through various waves of educational reform (Cheng, 2011; Yin, 2013). While purposefully addressing a range of local issues, the reforms have drawn heavily on educational and political trends in Western societies. The central aim of these initiatives was to transform the traditional examination-oriented education system into one valuing quality-oriented, student-centered education to cultivate talented and innovative citizens for the betterment of Chinese society (Huang and Wiseman, 2011; Qian and Walker, 2013). It has not been easy for schools and systems to absorb imported Western education policies into their time-embedded educative practices. Such adaptation is often more difficult in remote and poorer provinces where traditions tend to run even deeper than in the population centers. The clash between the old and the newly imported has resulted in “the co-existence of Western-style isomorphic structures at the surface level of ministries, constitutions or management practices and, behind this front, a complex interplay of cultural deep structures, entrenched attitudes, specific meaning-processing schemata, and vested interests” (Schriewer, 2012, p. 417).

Feature 3. Some of the contextual features themselves present a double-edged sword in that they can exert enabling and/or constraining effects on school leadership. Some contextual features exert a push-pull effect on leadership. In other words, they simultaneously facilitate and constrain the principals’ leadership power to improve student learning (Qian, 2018; Walker and Qian, 2015). If we do not recognize the seemingly contradictory role of these contextual features, we may also fail to unveil the complexities facing school leaders. Two examples of such contextual features are paternalistic values and the presence of the strong state.

As stated earlier, Chinese principals tend to assume a parent-like role at their school (Chen and Lee, 2008). In other words, they expect loyalty and subordination from teachers. It is sometimes difficult for Chinese principals to introduce and implement radical changes at their schools; their concern is that these may cause potential conflict and threaten organizational harmony. At the same time, a central theme of paternalistic leadership philosophies is that leaders need to care for their subordinates’ livelihoods and social and psychological well-being (Chen and Lee, 2008). In fact, Sargent and Hannum (2005) suggested that out of concern for teacher turnover, rural principals intentionally focused on “keeping teachers happy” (also see Qian et al., 2017). Principals understand that authority alone cannot guarantee teachers’ support and trust (Qian, 2018). School leaders tend to extend their care to teachers and try to address teachers’ concerns within and beyond the schools.

With the presence of the strong state, principals’ autonomy is circumscribed, and they are held accountable across a broad range of areas. Chinese principals depend on the government for job security and promotion and are expected not to question the authority of local governments (Walker and Qian, 2018a). In short, they are pressured to prioritize requirements associated with upward accountability. However, a strong state is also a source of support for schools. Support comes primarily in the form of relatively stable government funding, including the financial and intellectual resources provided to schools. The strong state provides top-down support as it imposes firm external control (Qian and Walker, 2019).

In sum, these three contextual features underpin the way school leaders enact their practices that may seem to be complex and puzzling in the eyes of outsiders. School leaders in China are influenced by both the “east wind” (home-grown values and philosophies) and “west wind” (ideas and theories imported from the West) (Tan and Chua, 2015). A challenge facing educational leaders in China is to translate imported policies and concepts such as student-centered learning and all-round student development into school realities (Huang and Wiseman, 2011). School leaders need to widen their leadership repertoire to include new capacities such as developing and designing curriculum, sharing power and delegating responsibility and providing individualized support for teachers. At the same time, school leaders work in a hierarchical system; thus, there is a general expectation that they will comply with established social norms. The struggle between the “west wind” and the “east wind” is constant and school leaders’ work lives are often fraught with tensions and dilemmas caused by the crosswinds (Qian et al., 2017).

An implication of the complexity of Chinese principals’ worklives is that understanding of educational leadership must be firmly located within the political and educative system; the sum is more than its parts (Tucker, 2011, 2014). Many constituent parts of the system, including the emphasis on exams, high parental expectations, paternalistic culture and strong state, present a double-edged sword. If we cannot grasp holistically the way the whole comes together, we risk providing skewed descriptions of what the Chinese school leadership looks like.

Learning from China?

The outstanding performance of Asian students on international exams has prompted a heretofore unseen enthusiasm for “reverse” cross-cultural learning about education – the West learning from the East. This trend has brought both new opportunities and new challenges to everyone interested in improving educational quality both within and outside of China through comparative studies, from policymakers to classroom teachers (McNess et al., 2015). The recently-emerged evidence-based understanding of Chinese educational leadership seems to challenge the stereotypical images widely presented in Western discourse.

A possible reason for the discrepancy is that outsiders tend to “fixate on China’s authoritarian political system” and this fixed view can discount the possible value and relevance of its decisions (Johnson, 2020). Although Chinese educational leaders, to a large

extent, need to run their schools in a highly centralized system today, it would be one-sided to label them as just autocratic or hierarchical – it's much more complex than this. Chinese school leaders adopt various strategies to build and strengthen internal accountability while also responding to external demands. On the one hand, the school leaders feel their responsibility is overwhelming and their autonomy has many constraints. On the other hand, they share a common belief that they must hold themselves accountable for the state of student learning across the school (Qian and Walker, 2019). This belief helps them to internalize many external expectations for performance and use different means to make the expectations shared and internalized by school teachers (Qian and Walker, 2019; Walker and Qian, 2018a).

We understand that education is a product of social systems that are culturally, historically and politically determined by “forgotten struggles and difficulties” and “battles long ago” (McNess et al., 2015, p. 296). Thus, different practices or policies have to be understood in terms of their cultural-historical contexts. There is no one best way of teaching and learning, and no one best way of leading. Caution is warranted to avoid drawing simplistic causal relationships between an identified policy/practice and outstanding student performance (Walker and Qian, 2019). Under this caveat, it is worth revisiting what can be learned at a general level about educational leadership in China. After visiting Shanghai, Thomas Friedman (2013) wrote in *The New York Times* about the secret of Shanghai success. He believed that if there was a secret, it was a relentless focus on the basics that make for high-performing schools but are difficult to pull off consistently across an entire school system. Similarly, if there is anything that Chinese educational leaders do that makes a real difference in student learning, it is their unremitting focus and deep commitment to the basics. These include:

- Strong emphasis on classroom teaching
- Priority on teacher capacity building
- Investment of time and commitment to teacher learning
- Awareness of building their personal professional authority
- Protection and care for teachers' professional and personal lives
- Focus on relationship building within a family-like school

Like everywhere, Chinese school leaders struggle through multiple challenges to maximize student success and wellbeing and weave a professional culture among teachers. Their purpose and passion match that of their principal colleagues internationally, even as the paths they both follow and blaze differ in form and density. The increasing volume of empirical research in the area coming out of China will further inform how and why they carve their paths to success and thus contribute to the understanding of school leadership across different countries, contexts and cultures.

Introduction

There is extensive empirical evidence indicating that school principals are one of the most salient determinants in the improvement of school performance (Adams, 2018; Day et al., 2016; Hallinger and Heck, 2010; Harris et al., 2019; Leithwood et al., 2020; Robinson et al. 2008). Hotmire (2018) states that school principals are primarily responsible for student achievement and they dictate the implementation of any school-level reforms. Thus, in order to create schools on par with the increasingly complex demand of the 21st century, principals play a key role in improving school outcomes by influencing the motivations and capacities of teachers, as well as the school climate and environment (Sun and Leithwood, 2015).

School principals must solve problems and make decisions concerning school functions such as curriculum design, financial resourcing, and assessment of student achievement on a daily basis (Drago-Severson et al., 2018). Consequently, leadership and leadership development continue to be a priority for policy makers in many education systems as a means to improve its educational system (Harris and Jones, 2015; Walker, 2015). Likewise, increasing attention has been paid across different countries to the type or form of leadership associated with school improvement and transformation (Hallinger and Lee 2014; Robinson et al. 2008).

As education systems continue seeking emerging leadership talents, Leimon et al. (2011) claimed that women are an under-utilized resource, therefore, women should be coached to lead. Stead and Elliot (2009) reveal two crucial observations in their study of women's leadership. First, women leaders draw upon both past and present experiences in their practice of leadership. Second, relationship to work (developing professional networks), relationship to others and relationship to place (where she lives) are the important spheres and influences in women leadership. Whereas, married women leaders face the greatest challenge in trying to balance work-family responsibilities.

It is a common knowledge that women and men have certain qualities that distinguish one from the other (Msila, 2013). Valerio (2009) points out that women tend to adopt a more democratic (participative) style of leadership where else men to adopt a more autocratic (directive) style. Additionally, research has shown women principals are more of transformational leaders than male principals (Msila, 2013). However, despite a gradual change today, women leaders are still far from achieving equality in the workplace (Stead and Elliott 2009). TALIS data show that in 2018, women are a minority among school principals in around half of the participating countries and economies with only 47% of principals are women (OECD, 2020).

Given that a robust knowledge base on women leadership is yet to be established, therefore, the aim of this article is to offer new insights into the essential characteristics of women leadership in Malaysia from the perspective of headmistresses in a small sample of Tamil vernacular primary schools and to suggest implications for the development of women as school principals in Malaysia. The article commences with an overview of the research context, the literature on women leadership in Malaysia and subsequently details of the methodology are outlined, followed by a discussion of the findings. Key themes and reflections are presented with some concluding comments and observations.

Research context

Currently there are 527 Tamil vernacular primary schools in Malaysia. These schools are divided into two categories: government-aided and semi-government aided. The Tamil language is the main medium of instruction. Tamil vernacular primary schools are mostly attended by Malaysian Indian students (aged 7 years–12 years) with the majority coming from Tamil descent and very few from other races. Tamil education is only available at the primary school level. Next, students must pursue their secondary and post-secondary education in national schools, where Malay will be the medium of instruction. As for its curriculum, these schools adopt the national curriculum as other government schools where Malay and English languages are the compulsory subjects (Ibrahim, 2018).

Women leadership in Malaysia

The question of whether women and men use different approaches to leadership has been the subject of numerous studies (Kolehmaineh et al., 2014; Lyman et al., 2005; Offermann and Coats, 2018) and whether gender and leadership are interrelated or independent has always been a constant source of debate (Husu et al., 2010). Since the 20th century, women leadership has become the focus and interest among researchers especially in the education sector (Abu-Tineh, 2013; Atieno, 2013; Bissessar, 2013; Kaiser and Wallace, 2016).

Tracing the historical research of women in educational administrations, Shakeshaft (1989) explained that women do not have the opportunities, career related experiences, or the benefits as given to men. But, the 21st century has seen more women appointed in leadership positions, taking on more businesses, and procuring more degrees than ever before. With their insightfulness, interpersonal abilities, and aptitude for lifelong learning, women are well positioned to achieve even greater career heights in the coming years (Wilén-Daugenti et al., 2013). However, even though women leaders have more access to education and are considered economically and politically equal to men, they are still overlooked when it comes to leadership positions (Mendez-Morse et al., 2015).

Women leaders constantly face barriers getting into higher positions as society largely feels males are better leaders (Brinia, 2012; Cubillo and Brown, 2003; Badura et al., 2018). This continues to become a challenge to women leaders in carrying out their roles and functions as they do not fit the norms of the society (Adams and Muthiah, 2020). Crosby-Hillier (2012) adds among the other barriers faced by young women leaders are multiple roles such as being a mother, a wife and at the same time an aspiring school leader. This indicates gender plays a role in shaping the types of leadership provided by women and men (Crosby-Hillier, 2012).

Research indicates that women have a different leadership style than men. Elmuti et al. (2009) indicates that women are generally more sensitive and encouraging leaders. Female school leaders perform better in coordinating curriculum, communicating school goals, promoting professional development, instruction supervising and evaluating, being visible in school and incentive provider for learning (Kaputa, 2009; Kwadzo, 2010; Mollel and Tshabangu, 2014). Prime et al. (2009) also postulated that women school leaders always practice self-development, they are good in building lasting relationships, inspiring and motivating others, and taking initiative to drive results.

Additionally, women school leaders were also found to be more collaborative in nature and gives importance to the growth of the school community as they empower others in the organization (Makura, 2012; Perkins et al., 2013). Women school leaders tend to focus on curriculum development, instructional programs management, developing teaching and learning in a collaborative and participatory manner (Nogay and Beebe, 2008), mentoring teachers to develop their instruction in the classroom and forming professional learning communities (Arar and Oplatka, 2016).

Methodology

The study reported in this article employed a case-study approach (Strauss and Corbin, 1998; Yin, 2013). The limitations of case studies in providing any causal explanations are fully accepted and acknowledged, and the study aimed to offer new insights into the essential characteristics of women leadership in Malaysia from the perspective of headmistresses in a small sample of Tamil vernacular primary schools. The findings therefore are indicative rather than definitive.

There are 15 government-funded Tamil vernacular primary schools in Kuala Lumpur. Most school heads are women especially in Tamil vernacular primary schools. Thus, 13 headmistresses were selected as samples in the study. These headmistresses have led their respective school for more than three years. Most of them have been teaching for more than 20 years and were a senior assistant before being promoted to become a headmistress. Information about the headmistresses is presented in Table 1 below. At the time of this study, the other 2 school that were excluded from this study had no head teachers and were awaiting appointment of a head teacher for their schools from the Ministry of Education.

The interviews were conducted using a semi-structured approach along with 24 open-ended questions as a standard protocol, and each interview lasted approximately 45 min. In ensuring that this research follows ethical standards, all headmistresses completed a consent form and were offered the opportunity to check their transcripts and to correct any errors. All interviews were digitally recorded and subsequently fully translated and transcribed into English. The transcripts were then transferred into

Table 1 Demographics of the headmistresses and schools.

<i>Code</i>	<i>Experience as a headmistresses/Year of appointment</i>	<i>School size</i>	<i>Students' socio-economic status</i>
School A	11 years/2010	193 students	Mostly low income
School B	10 years/2011	450 students	Mostly middle income
School C	9 years/2012	120 students	Mostly low income
School D	16 years/2005	350 students	Mostly middle income
School E	20 years/2001	135 students	Mostly middle income
School F	9 years/2012	330 students	Mostly middle income
School G	9 years/2012	290 students	Mostly middle income
School H	16 years/2005	320 students	Mostly middle income
School I	11 years/2010	290 students	Mostly low income
School J	8 years/2013	300 students	Mostly middle income
School K	14 years/2007	320 students	Mostly middle income
School L	9 years/2012	80 students	Mostly low income
School M	10 years/2011	150 students	Mostly middle income

ATLAS.ti 8, a qualitative data analysis software. The analysis of the qualitative data followed the coding and constant comparison techniques advocated by [Strauss \(1987\)](#).

The data were analyzed using a four-step thematic analysis approach. First, the transcripts of the recorded interviews were read to ensure familiarity with the data sets. Second, a coding framework was developed based on the international literature. Third, a constant comparative analysis was used to generate key themes and propositions for further investigation and further testing against the data ([Glaser and Strauss, 2017](#)). Finally, data were synthesized for emerging patterns and to generate emergent themes. The data were reviewed once again to detect any new emerging codes.

The next sections of this article present some of the findings from this study, highlighting some of the main themes emerging from the data analysis, particularly those related to women leadership.

Findings

Encourage teamwork

The data show that headmistresses award importance to teamwork because they trust that a well-supported leadership team in schools can instil a feeling of ownership. Through teamwork, these headmistresses motivate their teachers to work hand in hand in a meaningful way toward success. The headmistresses said it's important for teachers to work together to help the school attain its goals. They further elaborated as the headmistress; they should have the ability to make teachers work together as a team to achieve the school's goals and vision.

Accessible and caring

Most of the headmistresses in this study feel that they are accessible, caring and supportive to all the stakeholders in the school. They listen to their teachers' and students' problems and are readily approachable. Teachers and students can come and see them anytime. They also make themselves accessible to parents. There is a culture of give and take among them and their teachers.

Teachers are allowed leave school early if they have any personal matters to attend to. Most headmistresses felt that greeting students and talking to parents is a way of showing that they care and are accessible for all their students and parents.

Inclusiveness

Headmistresses in this study encourage inclusiveness rather than exclusiveness in all aspects of their school management. These headmistresses involve their staff and students to maintain a closely knit organization. Teachers are involved in all the school programs. These headmistresses believe this gives their teachers higher job satisfaction and that teachers give their fullest attention to their work. On certain occasions, they take their teachers out for lunch or dinner to foster closeness and greater relationship.

Additionally, parents and Non-Governmental Organisations are encouraged to be involved in school activities such as gotong-royong, canteen day and night classes to help the headmistresses achieve what they have planned. These headmistresses shared that these efforts have encouraged parents to participate and offer their full cooperation for any of the school activities. Among the contribution from parents and the Non-Governmental Organisations are setting up reading huts in the schools by donating books and money.

Instructional and curriculum knowledge

The headmistresses in this study are experienced educators which help them to better understand their job and help them to perform their duties more effectively. Most of them had been teaching for more than 20 years and were senior assistants before being promoted to headmistress. They have wide expertise in instructional and curriculum knowledge which provides them a platform for leading instructional efforts in their schools.

The headmistresses attempt to visit classrooms daily to observe instruction and student learning and identify what are the needs and strengths of their teachers and students. They are committed to making teaching and learning a positive experience in their schools. Their vast teaching experience equips them with the skills and knowledge on teaching, instructional leadership, organizational management, and this helps bring change to their schools.

Firm and perfectionist

Findings also indicate headmistresses in this study are firm, fair, and a perfectionist. They are firm in achieving their goals and are strict when it comes to work. These headmistresses claim they need to be firm in order to push their teachers to achieve the school goals. In addition, they are a perfectionist. These headmistresses ensure everything must be completed without any flaws. They also ensure all work is done perfectly and on time. There are some instances these headmistresses are labeled as workaholic and autocratic due to their firmness and perfections.

This is to raise awareness among their teachers so that they value the schools' goals above their personal goals. Admittedly, this has resulted in few teachers being stressed or burned out, however, these headmistresses felt it is for the betterment of the school and to ensure improvement in student outcomes.

Good communicators

Headmistresses in this study feel they are good communicators with the schools' stakeholders. They shared the need for good communication skills so that all schools' stakeholders can relate to their goals and vision and work together toward achieving these goals. These headmistresses believe communication skills are important if a strong relationship is to be built. It is impossible to achieve the school goals if stakeholders in the school do not communicate effectively. Furthermore, these headmistresses often communicate with their teachers in order to build a close relationship with them and earn their trust. This also enables the headmistresses to constantly motivate their teachers and immediately solve problems arising in their schools.

Diligent and hardworking

This study also found headmistresses work hard together with their teachers in order to achieve the school goals. Their work ethics are considered exemplary by their teachers. The headmistresses shared that the expectations from the schools' stakeholders spurred them to work diligently. Most of the headmistresses prepare their own presentations for the school meetings with data in hand so that all teachers will understand their expectations and instruction clearly.

Additionally, these headmistresses work hard to plan many types of programmes for their schools as part of their school leadership and management responsibilities. They emphasize teaching and learning and are constantly searching for new ideas to bring changes to their schools. In return, teachers are expected to work equally hard with them in order to increase students' achievement. Extra emphasis is given for teachers to attend professional development courses especially during school holidays.

Reflections

The study reported in this article aimed to illuminate the essential characteristics of women leadership in Malaysia from the perspective of headmistresses in a small sample of Tamil vernacular primary schools and to suggest implications for the development of women as school leaders in Malaysia. There are four main reflections from this study. First, most of these headmistresses understood women must become visible and vocal in our educational institutions. They must display their intellectual competence, values, knowledge, and vision for the future. If women are to emerge as members of the community, respected for their contributions and achievements, they must also be given an opportunity to lead in schools, where they could influence student learning outcomes (Esa and Leong, 2013). Recent studies have shown that women leaders tend to lead their organizations by showing women leadership characteristics which affects their schools' performance and transformation positively (Kythreotis et al., 2010).

Second, these headmistresses were able to describe their leadership practices as one that conforms to the standards of "women leadership". We could suggest, based on the data, that the thirteen headmistresses in this study are strong women leaders in certain respects. For example, these headmistresses are committed to teamwork (Mooney, 2011). They often act as the coordinator and facilitator in the team and motivates their school community to practice collaborative teamwork (Makura, 2012; Perkins et al., 2013). Additionally, these headmistresses were identified as caring and creative school leaders (Coleman, 1996). In this study, the headmistresses were also found to build a good relationship with all the schools' stakeholders such as its students, teachers, parents and NGO (Non Governmental Organization) for the betterment of the school.

Third, the data highlights that headmistresses in this study have vast teaching experience and great knowledge in instructional matters which make them well equipped to lead instructional and curriculum changes in their schools (Arar and Oplatka, 2016; Grogan and Shakeshaft, 2010). In addition, these headmistresses are good communicators. Effective communication has proven to increase staff involvement and commitment in the organization (Manafa, 2018). Particularly, the headmistresses have the capacity to juggle administrative and management duties. They demonstrated dedication and commitment to work extra hours, which is an emblem of a leader's devotion to their school (Southworth, 2002). Therefore, we could argue that the practices of these headmistresses are consistent with women leadership traits in leading the capacity building of their teachers and improving school outcomes.

Limitations and future studies

This study has several limitations. First, data were collected only from thirteen headmistresses from government-funded Tamil vernacular primary schools in Kuala Lumpur. At the time of this study, all government-funded Tamil vernacular primary schools in Kuala Lumpur are led by headmistresses. As such, future studies could include representative data from headmasters in government-funded Tamil vernacular primary schools in other states of Malaysia to enable a comparative study on the nature of their leadership.

Second, the samples in this study were only headmistresses from government-funded Tamil vernacular primary schools. Considerable evidence exists in the literature that suggests school heads are inclined to overestimate their own leadership practices (see Bellibas and Gumus, 2021; Thien et al., 2021). As stated earlier, the findings of this study are indicative rather than definitive. Future studies could gather additional evidence from teachers to provide an objective view of headmistresses' leadership practices in Tamil vernacular primary schools.

Conclusion

In summary, the evidence presented in this article indicates that headmistresses in selected Tamil vernacular primary schools in Malaysia possess some of the characteristics of women leadership. However, some of their leadership traits are dependent upon the teaching and learning process in their schools. The school's success depends upon the leadership enactment of the headmistresses. When the school leader is persistent in innovating better teaching approaches to improve students' outcomes, learners are likely to achieve as the school succeeds (Adams et al., 2020; Adams, 2018; Msila, 2013).

The findings of this study have significant implications for school leadership, school leadership preparation, and practice. The improvement of school performance has less to do with the school leader's gender and more to do with commitment and vision (Msila, 2013). Women leaders are leading their schools in purposeful ways (Aaron, 2020). They adopt a democratic (participative) style of leadership, emphasize capacity building of their teachers and improving school outcomes based on sheer dedication, vision and commitment to work. The Malaysian Ministry of Education would benefit from this knowledge and use this to develop resources, and better support future and new women school leaders in Malaysia.

Introduction

Over the past 20 years, an extensive body of literature on educational leadership has found that the quality of school leadership has significant, albeit largely indirect effects on student learning outcomes (Hallinger, 2011; Leithwood et al., 2004; Louis et al., 2010). Although the school effectiveness research has emphasized student learning progress and attainment as key criteria for determining leader effectiveness, Day and Sammons (2016) asserted that student achievement alone should not be used as the measure of "school success". They contend that "successful schools" also embed positive social values among learners, enhance skills and attitudes that support lifelong learning, provide a foundation for successful citizenship, and support other social outcomes that meet the requirements of education in 21st society. This revised assumption has been the foundation of a global knowledge base developed under the auspices of the *International Successful School Principalship Project* (ISSPP) (e.g., Day et al., 2016; Leithwood, 2005; Mulford and Silins, 2011). At present, this worldwide study has contributed more than 100 multi-site case studies that elicit principal perspectives and practices associated with successful schools from more than 20 nations (Gurr, 2017).

The ISSPP studies find that successful school principals share many similar values, characteristics, and accomplishments across these diverse settings. In addition, the findings also reinforce assertions that the strategies which principals use to support school success are responsive to the external contexts in which they work (Day and Sammons, 2016). While this research represents the most extensive global comparative project on school leadership, it is largely comprised of research conducted in Western and English-speaking societies. Inclusion of research from emergent regions of the world may lead to a more diversified and refined view of successful school principalship (Walker and Hallinger, 2015).

Thailand, the second most populated nation in Southeast Asia, has a distinct geographical, political, and cultural context that has shaped the development of its education system (Fry and Bi, 2013). This creates a unique set of institutional and cultural forces that shape both the role definition and enactment of the principalship in Thailand (Hallinger, 2004; Kulophas and Hallinger, 2021). Thus, any discussion of "successful principalship" in the Thai context must begin with a consideration of how the principalship has evolved and the expectations that different stakeholders have for the educators holding this role. Only then, can we begin to assess the nature of practices that enable principals to meet those expectations. Thus, this review chapter addresses two research questions:

1. How is successful school principalship defined, explicitly and implicitly, in the Thai language literature on school leadership and management?
2. What constitute successful school principalship practices in Thailand?

Our approach to addressing the first research question seeks to elicit perspectives on “successful school principalship” in the Thai language literature on educational leadership and management. Following this, we review studies that have studied the practices of principals who have been characterized as “successful” based on locally-adopted criteria. Drawing upon this literature, we synthesize practices that Thai scholars suggest are associated with “successful principalship” in Thailand. In both sections of the paper, the discussion is placed within the political, societal, and cultural context of Thai education.

Successful school principalship: global perspectives

Launched in 2001, the International Successful School Principalship Project (ISSPP) has aimed to build a global body of knowledge on how principal practices and characteristics contribute to school success. The founding members came from eight nations: Australia, Canada, China, Denmark, England, Norway, Sweden, United States. At the outset, they decided to conduct a series of case studies that would investigate successful principal practices in their respective countries. They agreed to use the term “successful” instead of “effective” to incorporate not only student learning outcomes, but also the development of positive values, life-long learning, and productive citizenship behaviors (Day and Gurr, 2018; Day and Sammons, 2016). The selected “successful” schools and principals in these studies mostly demonstrated one or more of the following criteria: higher-than-expected student achievement on national tests where available, principals’ excellent recognition within the community or school system as acknowledged by peers or government officials, and other context-specific notions of success such as awards for school management, principalship or excellence projects (Gurr, 2015).

The global research associated with the ISSPP project has collectively contributed to a deeper understanding of how school leadership contributes to school success. Evidence from the international case studies echoed four common features of successful school principalship: establishing moral purpose and creating a positive school culture, developing teacher professional competence, restructuring the school organization and sharing leadership, and redesigning curriculum and enhancing teaching and learning (Leithwood and Day, 2007). Moreover, successful school principals strategically adapted their leadership practices to suit the environment in which they work (Day and Sammons, 2013).

While the current body of knowledge that has accumulated through the ISSPP project is derived from a pool of over 20 nations, most of the studies have come from Anglo-American and European societies. Thus, despite being one of the largest and most culturally diverse regions of the world, so far only three studies have been conducted in Asian societies: China (Wong, 2005), Indonesia (Raihani, 2008), and Singapore (Gurr et al., 2016). Thus, this review seeks to add further to the diversification of international knowledge on successful principalship.

Thailand context

As noted above, a fundamental assumption of the ISSPP project is that successful school principalship is contextualized (Day and Sammons, 2016). This recognizes that the practices enacted by principals is shaped by expectations embedded in the cultural, political, and institutional systems where their schools are located (Bajunid, 1996; Belchetz and Leithwood, 2007; Hallinger and Leithwood, 1996; Hallinger and Thang, 2014; Walker and Hallinger, 2015).

Education context in Thailand

Driven by the 1997 Asian economic crisis, Thailand undertook its most significant attempt at educational reform by enacting the 1999 National Education Act (NEA). This ambitious platform of reforms aimed to transform teaching and learning and overhaul the educational management system to ensure sustainable economic and social development (Fry and Bi, 2013). Despite its grand ambitions, scholars have characterized the actual reform implementation as slow, stagnant, and unsustainable (Fry and Bi, 2013; Fry and Sangnapaboworn, 2018; Hallinger and Lee, 2011). While the MOE made some progress in restructuring its administrative organization, widespread, significant improvements in the quality of teaching and learning in schools have not been realized (Fry and Bi, 2013; Hallinger and Lee, 2011; Sangnapaboworn, 2018).

For example, in 2017 an OECD report found that despite spending more time in classroom learning, Thai students still performed poorly when compared on multinational academic assessments (OECD, 2017). According to Fry and Bi (2013), classroom teaching in Thailand continues to stress teacher-centered approaches that rely on memorization and rote-learning. Active learning which engages students, enhances their critical thinking, and develops creativity have yet to gain a firm foothold among a critical mass of teachers (Hallinger and Lee, 2011).

Several system-level factors have contributed to the stagnation of Thailand’s educational reform (Fry, 2018). These include over-centralization, political interference, lack of commitment to a reform strategy, misalignment among main educational agencies, poor policy implementation, and insufficient investment in human development (Atagi, 2011; Fry and Bi, 2013; Fry and Sangnapaboworn, 2018). For example, since 1999, the MOE has been led by 21 different education ministers, averaging nine months per minister in the position. This has resulted in frequently shifting policies and eroding confidence among educators and the public. Although the NEA began to address the need for decentralization, in practice the education system remains highly centralized, particularly in the domains of finance and human resource management (Atagi, 2011; Fry and Bi, 2013).

While Thailand has invested approximately 20% of its annual fiscal budget on education (The World Bank, 2017), access to quality education remains unequal and limited among underprivileged groups of society (Fry and Sangnapaboworn, 2018; OECD/UNESCO, 2016). Moreover, due to a declining birth rate, the Thai government has sought to curb spending by reducing the recruitment of new civil servants, including teachers. This downsizing policy has caused serious teacher shortages, especially in critical subjects among rural and disadvantaged schools (Atagi, 2011).

The fast changing, competitive world economy has increased the urgency for the Thai government to transform its education system. In 2017, the current government adopted a new long-term policy called “Thailand 4.0”, which aspires to transform the economy and enable the nation to escape the “middle income trap” (Royal Thai Embassy, 2017). This policy reaffirmed the vital role of education to prepare new generations of citizens capable of meeting 21st century challenges. Ken Kay, President, Partnership for 21st Century Skills (AksornAct, 2017), asserted that Thailand 4.0 would not be possible without first developing “Educator 4.0”.

Thailand 4.0 has undoubtedly intensified the already complex role of Thai principals. Scholars have asserted that Thai school administrators lack essential competences to lead changes in teaching and learning (Hallinger, 2018c; Hallinger and Lee, 2013a). Thai principals were conventionally expected to perform administrative tasks such as resource planning, scheduling, budget management, facility management and other routine management procedures. While the concept of instructional leadership first entered the lexicon of school leadership in Thailand in the early 2000’s, only a small number of Thai principals have actively adopted this perspective on their role (Hallinger and Lee, 2013b). This has made the sustained implementation of educational reforms even more challenging (Fullan, 2002).

These continuing limitations in the capacity of Thai principals to lead and support educational reforms has been linked to systemic weaknesses (Fry and Sangnapaboworn, 2018; Hallinger, 2018b). Thai principals are enlisted by self-selection and vetted through formalistic, rules-oriented examinations (Chiangkul, 2016). In addition, the systems for preparing and developing school principals remain geared toward management (e.g., scheduling, facilities, budget, personnel) and administration (e.g., rules, processes, and policies), rather than “leadership” for teaching and learning. Thus, scholars and policymakers have concluded that Thai principals have neither been selected nor trained with the perspectives and skills needed to bridge the gap between reform policies and classroom practices (Hallinger, 2018b; OECD/UNESCO, 2016; Varavarn, 2011).

Cultural context

How Thai school principals approach their role is not only influenced by national laws and policies, but also by the cultural values and norms of Thai society (Bush, 2012; Hallinger, 2018a). It is common knowledge among Thai citizens that the three pillars of Thai society are, as represented by the three colors of Thai flag, nation (red), religion (white), and the king (blue). More than 96% of Thai citizens are Buddhist. Therefore, to understand Thai culture, it is vital to recognize how Buddhism has influenced Thai ways of living (Fry, 2018).

One of the most important teachings of Buddhism is *ariyasat sii* (four noble truths). The *ariyasat sii* state that the root cause of human suffering is craving. To be liberated from a cycle of suffering, one should practice the noble eightfold path or “the middle way”, which leads to nirvana or freedom from attachment (Tsering, 2005). Buddhist influence is evident in the redefinition of national educational goals in 1999. The NEA stated explicitly three goals that graduates of the Thai education system should possess: *geng* (capability), *dii* (morality), and *kwarm sook* (satisfaction or happiness). Thus, even when faced with the need to respond to the economic crisis of 1997, national policymakers were unwilling to sacrifice the broader mission of education to the sole purpose of academic learning.

Thailand’s late King Rama the IX developed the Sufficiency Economy Philosophy (SEP), a set of principles for living sustainably as individuals and a society. This, represents a good example of how the value of “the middle way” is widely recognized and applied in Thai society (Piboolsravut, 2004). Consistent with “the middle way” concept, the SEP asserts that, even in a fast changing and competitive world, one should live a balanced life, working and consuming moderately, responsibly, and self-consciously.

For the past several decades, schools across the country have sought to integrate the SEP in curriculum and school management. Over the past decade, the Virtuous Schools Project, supported by the King Rama IX Foundation, implemented a model of SEP schooling in more than 20,000 schools across Thailand (Dharmapiya and Saratun, 2020; Hallinger and Suriyankietkaew, 2018). The philosophy underlying this ambitious project stated that these schools should graduate students who have developed the “enduring virtues” of moderation, prudence, generosity, and cooperation. Virtuous Schools reorient their operations to meet goals related to economic development (e.g., academic and personal life skills), environmental awareness, social justice, and cultural preservation (Dharmapiya and Saratun, 2020).

Another distinguished Buddhist doctrine is called *phrom wihan sii* (four sublime attitudes). These comprise *metta* (kindness), *karuna* (compassion), *mudita* (vicarious joy), and *ubekkhā* (equanimity). *Phrom wihan sii* underlines the importance of giving, merit, tolerance, and calmness instilled in Thai culture. It is also considered an essential principle for managing schools, where principals are expected to exhibit generosity and mercy toward teachers (Rukbanglaem et al., 2015; Srichandari and Thanaphaet, 2020).

Hofstede’s cultural dimensions offer an additional lens through which to analyze the “comparative” features of Thai culture. According to Hofstede et al. (2005), the main features of Thai culture include high power distance, collectivism, and femininity, and uncertainty avoidance. As a high power distance culture, Thai people accept that power and status are distributed unevenly in society. Thai subordinates are inclined to obey their supervisors’ orders in return for security and support. A Thai custom called *kreng jai* (fearful heart) can be observed in schools where Thai teachers dutifully follow the principal’s instructions despite suppressed disagreement. This culturally ingrained norm of compliance with authority engenders a culture of passive resistance, low

commitment, and corruption throughout all levels of the Thai education and governmental system (Fry, 2018; Vichit-Vadakan, 2017).

Thailand is also a highly collectivist and feminist culture. Honoring tradition, maintaining harmony, and avoiding conflicts are essential in a collective society (Hofstede et al., 2005). In staff meetings, Thai teachers seldom ask questions or make comments for fear of creating tensions with the principal or among colleagues. In a highly feminist culture, holistic well-being, caring for others, kindness, and personal relationships are treasured. These values are encompassed in an important Thai norm of *tum bhun* or making merit by doing good deeds. This explains why, despite their low pay, Thai teachers are often motivated to work longer hours for disadvantaged students in the absence of any financial gains. Similarly, a strong need to cultivate personal relationships offers insight into why Thai principals normally spend extended hours for off-school responsibilities such as attending communal rituals and ceremonies (e.g., births, deaths, holiday ceremonies, temple ritual) which have nothing directly to do with their “in-school roles”.

Lastly, based on Hofstede et al. (2005), Thai people are generally risk averse. Moral purpose must be communicated and understood by the group before any change is initiated. To reduce uncertainty and accelerate reform, oftentimes Thai educational authorities prioritize rules, regulations, and policies. For example, professional learning communities (PLCs) were not extensively practiced in schools until MOE formally commissioned as the main professional development strategy in 2017 (Prabjandee, 2019).

Review method

Identification of sources

In order to explore the meaning of successful principalship in Thailand, we turned to relevant Thai language literature published in Thailand. Our rationale for focusing on Thai language publications was two-fold. First, as noted earlier, relatively few articles on educational leadership and management in Thailand published in the international literature have extensively referenced Thai language literature. Second, we believed that the subset of the Thai literature published in national Thai language journals might capture a somewhat different complementary perspective on the meaning of successful school principalship.

We set the start year for our search at 1999 due to its historic significance as the year the NEA was enacted. The search was conducted in the Thai-Journal Citation Index (TCI) which is the primary digital archive of academic articles published in Thai journals. Due to its formal role in determining journal impact and ranking, TCI is considered the only official journal indexing authority of Thailand.

We started by using the key words in Thai language for “success AND administrator AND school” (ความสำเร็จ ผู้บริหาร สถานศึกษา) to search for related articles. In Thai, the term “successful” could also refer to “famous” (มีชื่อเสียง) or “recognized” (ได้รับการยอมรับ). Therefore, two additional searches were conducted using the key word “famous AND administrator AND school” and “recognized AND administrator AND school”. After removing duplications, a total of 366 articles were identified. “Administrator” was used due its common usage in the Thai language when referring to school leaders, managers, or principals.

We screened titles and abstracts to eliminate ineligible articles based on the following exclusion criteria: (1) lack of focus on education; (2) focus on vocational or higher education administration; (3) insufficient focus on school administrators. According to Dixon-Woods et al. (2006), an interpretive review should prioritize “relevance” over “type of publication”. This informed our decision to include both empirical and non-empirical articles, since both could offer insight into “Thai perspectives on successful principalship”. After this screening process, a total of 32 journal articles remained (see Fig. 1).

We extracted document information such as author, year of publication, education level, participant, and methodology, and categorized these as document variables. Next, we created an analytic framework based on the existing ISSPP literature by specifying common characteristics and practices of successful school principalship. While this analytic framework was used as an initial guide for our coding, we added new codes and combined existing codes with new ones that emerged during analysis. We used MAXQDA software version 11.0 to assist in coding text and recategorizing codes during our data analysis.

The 32 eligible publications were comprised of 23 empirical and nine non-empirical articles (see Table 1). Of 23 research articles, 15 were quantitative studies including 12 that featured hypothesis testing. The other eight were either single-case or multi-site qualitative case studies. We categorized the nine non-empirical articles as “perspective” since they largely offered opinions on the characteristics school principals “should” possess and/or what practices they “should” demonstrate to be successful.

Findings

This section of the chapter seeks first to elicit a Thai perspective on the meaning of “successful school principalship” from the Thai literature in educational leadership and management. Then we examine practices that flow from this perspective.

What is successful school principalship in the Thai literature?

In the qualitative studies, most authors defined successful school leaders as someone who had been recognized as exemplary in school management, received a national or regional award, or obtained high professional rank. Principals whose schools received excellent ratings or certification by local school districts or the Office for National Education Standards and Quality Assessment

Fig. 1 Process for searching and inclusion of the articles.

(ONESQA) were identified in six qualitative articles as “successful principals” (e.g., Piungam et al., 2015; Pruetikul and Anannawee, 2014; Sankaew and Chusorn, 2016). All Thai schools must undergo educational quality audits by the ONESQA (2011) every five years. Schools that achieve ratings of “good” or “excellent” quality typically display this certification in front of the school.

Some authors described exemplary schools such as those selected by the MOE or school districts to lead high-profile academic initiatives, most notably under the auspices of the “world-class standard school” (WCSS) project (Issara and Thee-asana, 2017; Somprach, 2017). This initiative was launched in 2010 to raise the quality level of Thai education to international standards and develop students into capable global citizens. The program inspected and certified a selection of secondary schools nationwide that demonstrated outstanding improvement and innovation in curriculum, teaching and learning, and school management.

It is, however, worth noting that WCSS schools tend to be urban, advantaged, and highly selective. Thus, “success” in this program may have more to do with student composition, school culture and the environment than the principal’s practices. Moreover, due to frequent principal turnover in the Thai education system, a principal could be recognized despite having little to do with the school’s recent success.

Principals’ excellence in school administrative tasks was frequently mentioned in perspective articles as an indicator of successful school principalship. This reflects the “rules-based orientation” of school administrators within all levels of the Thai education system (Fry, 2018; Yuenyong, 2019). Excellence was most frequently determined by recommendations from school district officials without any systematic approach to assessing how principals’ performance had impacted their schools.

Receipt of national or regional awards are another prominent indicator of successful principalship. For example, to honor principals for their exemplary professional attainments, the Teacher’s Council of Thailand (TCT) and the Office of the Basic Education Commission (OBEC) present national awards on an annual basis. Accolades for school management featured in five entries as an important qualification for case selection of “successful principals” (Issara and Thee-asana, 2017; Kukkong and Eungpuang, 2014; Pruetikul and Anannawee, 2014; Sankaew and Chusorn, 2016; Thetarat and Sripokangkul, 2018).

Five quantitative studies purposively set the scope of their research on schools that had achieved awards. Most studies selected schools that were granted “Royal School Award”, a highly prestigious award inaugurated and bestowed by the King Rama IX since 1963 (OBEC, 2017). The Royal School Awards, widely considered the epitome of success for any Thai school principal, are given to winning schools from each region and category according to academic level and school size.

Several qualitative studies used “professional rank” as a criterion for identifying successful principals. Academic status (*wittayathana*) is a professional ranking system for teachers and school administrators governed by the Office of the Teacher Civil Service and Educational Personnel Commission (OTEPC). The current professional ranking system for school principals in Thailand starts from level 1 (ordinary) to level 5 (expert).

Two qualitative studies (Kukkong and Eungpuang, 2014; Somprach, 2017) used *wittayathana* level 4 (expertize) as a selection criteria for successful principalship. It should be emphasized that progression within this ranking system results from “ticking the boxes” on measurable bureaucratic criteria such as years of experience, educational level attained, attendance at a series of Ministry-sponsored workshops, receipt of school awards, and completion of a school-based research project. Moreover, the link between acquiring awards and ranking has created a scheming of “scratching each other’s back” within a school district. It is common knowledge that awards can be given to schools or principals based on skeptical criteria to facilitate qualification for rank promotion.

To further explore the meaning of successful school principalship, quantitative studies were further examined with a focus on the operational definition of the dependent variable used to define “success”. We found that many authors used the terms “school success” and “school effectiveness” interchangeably. While “school effectiveness” was used frequently in the studies, the authors seldom applied the type of student learning criteria typically sought in the international literature on “school effectiveness” (Schrems, 2000). For example, as noted above, awards and ranking criteria seldom prioritized equity in student learning opportunities or outcomes. Instead, “school effectiveness” was treated as a catch-all term which encompassed the ability to solve school

administrative problems, use of “best practices” in school administration (e.g., technology), or school knowledge management (Duangtongkul et al., 2016; Phutthasen et al., 2016; Promkan et al., 2013; Suk-ied et al., 2015).

Successful principal practices in Thailand

Leadership vision

The authors of these articles largely concurred that successful principals had clear, long-term visions, which were used to set future direction and guide strategic planning for the school (e.g., Issara and Thee-asana, 2017; Kukkong and Eungpuang, 2014; Piungam et al., 2015; Somprach, 2017). Although Thailand is a highly hierarchical society and school principals are expected to follow the system directives, some authors observed that “successful school principals” had their own personal visions for change (Bulan, 2017; Chaityakit et al., 2020; Raksanakorn, 2020). Bulan (2017), for example, asserted that Thai principals cannot afford to be complacent, relying on “Thai-style” school management by simply reacting to orders from higher-ups and following daily management routines. They should proactively create and implement strategic plans for school improvement, following up and reporting to superiors on what they have achieved and what resources are needed (Bulan, 2017). This quotation highlights the fact that this “leadership” approach is not, however, the norm among Thai principals more broadly.

Decision-making and problem-solving

Several authors found that successful school leaders studied rules and regulations carefully, looked for rules that could leverage their own strategies, gathered information from stakeholders, and engaged them in a shared decision-making process (e.g., Kukkong and Eungpuang, 2014; Pruetikul and Anannawee, 2014; Sankaew and Chusorn, 2016). Two features stand out here. First, going beyond “knowing the rules” to adapting and leveraging them for local empowerment. Second, successful principals frequently sought input from teachers and school board members before enforcing any actions. These practices not only ensure legal compliance, but also responsiveness and acceptance from the parties responsible for support and implementation (Kukkong and Eungpuang, 2014; Thetarat and Sripokangkul, 2018).

Successful principals displayed self-efficacy and flexibility in dealing with challenges (Sankaew and Chusorn, 2016), learned from others and tried to experiment in their own schools (Somprach, 2017). Integration of digital technology in school management was cited by several authors as an example of how successful principals demonstrated continuous learning and adaptability for the benefit of their schools. For instance, Somprach (2017) found that technology integration supported the use of data-driven decision making, use of learning technologies by teachers, and enhancing within-school and school-home communications.

Leading teaching and learning

Managing curriculum and pedagogy was noted as a priority among successful school principals. One multi-site case study depicted three exemplary principals who engaged proactively in pedagogical activities at their schools (Piungam et al., 2015). They prioritized students’ learning by designing the school curriculum around the community context, planning for teacher supervision and evaluation, promoting life-long learning, and encouraging teachers to try new teaching approaches. In another study, a Buddhist school principal led teachers to change their routine practices by collaborating on a learning innovation program called *jittasuksa* or spiritual study (Somboon and Kornpuang, 2018). In this project, the principal acted as a spiritual coach encouraging teachers to reflect on and refine personal professional development and practices.

Another case focused on a principal’s efforts to lead a school that was participating in the Virtuous Schools Project with the aims of instilling self-reliance and a sustainability mindset in teachers, young children, and community members (Thetarat and Sripokangkul, 2018). The school principal worked with teachers and the community to develop a more relevant school curriculum and support the use of more active teaching and learning activities. He also carefully selected and trained teachers and made memoranda of agreement with provincial teacher colleges to lend instructors for scientific subjects with high teacher shortage.

Communication and conflict management

Another key practice for successful school principalship in Thailand concerns communicating creatively and positively. According to Pruetikul and Anannawee (2014), successful principals displayed high assertiveness while remaining approachable for teachers and parents. They chose words wisely and carefully when interacting with others, especially when giving teachers feedback. This encouraged teachers to have the courage to come forward and ask for professional or personal advice. This practice was supported by several opinion pieces (e.g., Chantanontree and Thongpan, 2017; Rukbanglaem et al., 2015; Srichandari and Thanaphaet, 2020) which asserted that school leaders should use kind words (*piyavaca*) to foster a climate of friendship (*kanlayanamit*) among school staff.

Moreover, demonstrating *piyavaca* and enabling *kanlayanamit* were highlighted as essential in managing conflicts effectively in schools. For example, Somboon and Kornpuang (2018) reported that in one case school it was common for tensions and disagreements to arise among teachers in professional learning community (PLC) meetings. The principal sought to manage conflicts productively by asking constructive questions, offering positive feedback, prompting reflection, and facilitating teachers’ engagement. Thetarat and Sripokangkul (2018) used a Thai proverb to convey the essence of a successful principal’s approach in managing conflicts: “neither let a lotus get bruised nor let water get turbid” (*bua mai hai cham naam mai hai kun*). In a collectivist culture where conflicts are often swept under the rug, this suggests a capacity for negotiating a compromise during disputes. This allows the principal to fulfill the goals of maintaining harmony while moving forward on the school’s agenda.

Developing the school's culture

The studies further highlighted practices used by successful school principals to support teacher professional growth and wellbeing, and a collaborative school culture. Muktarakosa et al. (2018) opined that, to succeed in the Thailand 4.0 era, school principals must develop teacher professional capacity to the fullest. Pechsangkoon and Thanaphaet (2020) also suggested that school principals should both encourage and advise teachers to climb up in the professional ranking system.

In the past, most Thai principals traditionally relied on MOE to arrange off-site teacher training sessions. This train-the-trainer model of teacher professional development required teachers to leave classroom for training that was often irrelevant to their needs (OECD/UNESCO, 2016). The nationwide PLC initiative, introduced by the MOE in 2015, gained tremendous support from many of the successful principals described in the qualitative studies (e.g., Piungam et al., 2015; Somboon and Kornpuang, 2018; Somprach, 2017). For example, the principal of a large provincial school received national recognition for his use of “lesson study” as a tool for teacher professional learning. Another principal formed a professional learning network with other schools, which led to an annual fair that showcased teaching and learning innovations by affiliated teachers (Somboon and Kornpuang, 2018). These examples highlight how the selected principals went “beyond compliance” to make the new PLC policy work for their teachers and schools.

One of the major tasks of successful school principals was building relationships in the school's community. Indeed, the quantitative studies emphasized community engagement as a significant factor underlying the success of principals (e.g., Banlue and Tiacharoen, 2018; Duangtongkul et al., 2016; Prasongsuk et al., 2015). Successful school principals strategically used their attendance at “culturally mandated” events in the community (e.g., funerals, weddings, holiday ceremonies) to strengthen relationships with stakeholders (e.g., parents, business leaders, alumni, monks). Investing time in relationship building was essential to obtaining the auxiliary financial, human, and materials resources needed to advance the school mission (Kukkong and Eungpuang, 2014; Piungam et al., 2015; Sankaew and Chusorn, 2016; Somprach, 2017).

One study described a path to success of a female principal, who credited community engagement as a major factor (Kukkong and Eungpuang, 2014). Throughout her career as a principal, she had applied to take part in a series of demanding school initiatives which were used as “catalysts” to energize her teachers and support school development. Participation in these initiatives imposed a higher level of public accountability in academic progress and teaching and learning standards. Realizing that participation came with both threats and opportunities, she invited a network of diverse stakeholders (i.e., teachers, parents, alumni, temples, private businesses, politicians, local authorities) to actively engage in school improvement efforts. This strong community engagement allowed the school to gain financial and public support, access cutting-edge know-how, and expedite administrative procedures.

Community engagement is rooted in Buddhist belief that right behavior is grounded in the local context (*parisannutà*) (Chanantree and Thongpan, 2017). Indeed, *parisannutà* is one of seven *sappurisa dhamma* or Buddhist principles for public administration (Sutamchai et al., 2020). Thus, proactive engagement with the community would help principals learn how to conduct themselves according to local cultural norms and traditions, thereby gradually gaining acceptance and support from the community.

Lastly, following the concept of mindfulness (Sutamchai et al., 2020), several successful principals consciously modeled values and norms through their own behavior (e.g., Prasongsuk et al., 2015; Promkan et al., 2013). For example, several principals sought to inspire to change by demonstrating ethical behavior and decision making, dressing professionally, and speaking politely (*piya-vaca*). This enabled them to gain respect and trust from peers and subordinates (Charoenpornsakul et al., 2018; Prasongsuk et al., 2015). They also acted as role models by devoting their time to worthy public causes (Duangtongkul et al., 2016).

In several qualitative studies, successful principals modeled themselves as learning leaders, sharing their own learning and growth with teachers. This gave principals more credibility when interacting with teachers, especially after the following launch of the PLC initiative. It also enabled them to develop new perspectives and skills and adapt to meet the changing demands of their profession and schools (Somprach, 2017).

One primary school principal shared his story of growing up as a *dek wat* (temple boy) in his youth to obtaining a doctoral degree in educational administration from a reputable university. In Thailand, it is not uncommon for a poor family to send their young son to become a temple boy to receive better education and opportunities (Fry and Sangnapaboworn, 2018). This principal credited his desire to learn by regularly assessing himself and finding opportunities to study from seasoned mentors.

Discussion

This review set out first to develop a deeper understanding of what it means to be a “successful school principal” in Thailand. In this regard, we feel that we have achieved partial success. Our findings suggest that “successful school principals” in Thailand are largely identified by their perceived excellence in wide-ranging school management tasks, awards gained by their schools, and the attainment of high bureaucratic rank. These indicators reflect Thailand's hierarchical culture in which stakeholders generally demonstrate respect and loyalty for people who have achieved recognition (e.g., awards) or status (e.g., rank), regardless of the basis. In a society where principals are government officials, attaining bureaucratic rank is essential to gaining power and social acceptance (Hallinger, 2004; Jirapornkul and Yolles, 2010). Thus, a school principal's merit is proven by the awards and rank attained.

While these criteria are not inconsistent with findings reported in the broader ISSPP literature, in the Thai context neither awards nor rank tend to be based upon data that describe the principal's contributions to the school's performance. Instead, the school's performance is frequently used as an indicator of the principal's performance. Similarly, we suggest that the attainment of

bureaucratic rank is more of an exercise in “ticking the boxes” than an indication of positive impact or substantive achievements by principals in their schools. This approach to using school awards and bureaucratic criteria to define successful principalship in Thailand reflects dominant values and norms of the nation’s culture. For example, Redmond (1998) observed that “face” or outward appearance central to understanding social behavior in Thailand.

Whereas Western power is held by “heads” ... Thai leaders are *hua na*—“heads in front,” [*hua* meaning head and] front being rendered by the word *na*, which means “face” ... the facial aspect of being in front indicates that leaders are meant to conform to the central values of Thai culture, namely, facial values. Leaders are neither born nor made in Thailand; like faces, they are made up. (Redmond, 1998, no page number)

This emphasis on face explains why school awards and rank play such a large role in determining who is perceived as “successful” in the Thai education context. It also explains why principals work so hard to rise in bureaucratic rank. Principals with higher rank are entitled to wear more elaborate uniforms and become eligible for placement at “better schools”. The fact that higher ranked principals tend to gain access to “better schools” reinforces the corollary trend whereby principals from award-winning schools are perceived as successful.

Our findings further suggest that the practices of successful school principals in Thailand are broadly consistent with themes identified from the ISSPP project. Indeed, many of the practices identified in this review are informed by well-known Western leadership principles. These include vision and direction setting, stakeholder engagement, capacity building, conflict management, decision-making, fostering a collaborative culture, and to a lesser degree instructional leadership.

Yet, this review has also highlighted significant ways in which these globally disseminated school leadership and management practices enacted by successful principals are “responsive to the institutional and cultural context” of Thai schools. Successful principals leverage the requirements of a highly centralized, rules-based education system. They find opportunities in the “mortar that lies between the bricks” in a tall, rigid, bureaucratic structure. Well-honed communication and conflict management skills are essential in a collectivist and feminist culture such as Thailand. Successful principals reportedly demonstrate the ability to facilitate open discussion, give constructive feedback, and manage conflicts among teachers. Notably, they used these skills to gain the most from reform policies such as professional learning communities which seek to bring principals into closer contact with teachers, and teachers with one another.

Successful Thai principals strategically utilized their time out-of-school to form strong networks that bring in fiscal support, knowledge, and cooperation from outside the school. They realize that gaining support from external stakeholders is key to achieving their visions for change. This emphasis on engaging the community concurrently serves both the cultural expectation for the *kru yai* (head teacher) to be a “visible face” in the community and the practical purpose of gaining additional resources in an underfunded education system. Lastly, these principals sought to act as ethical and professional models for values they sought to embed in their schools.

Also of interest is what we did not find in the studies. An increasingly influential leadership approach absent from mention in any of these studies was distributed leadership (Spillane, 2005). In the Thai context, the terms “leader” and “administrator” are still used synonymously, and leadership is wholly associated with position or role. Thus, it is rather hard for a Thai principal, teacher, or parent to conceive of someone being a “leader” if s/he is not an administrator. Similarly, instructional leadership, while somewhat more evident than distributed leadership, did not emerge as a significant role orientation in our findings.

Conclusion

At the outset of this paper, we noted the gap between the Thai government’s vision of education reform and actual changes in educational practices in schools and classrooms (Fry and Bi, 2013). Our analysis of the “successful principalship” in Thailand offers potential insight into why Thai schools been unable to adapt to a new mission. Thai principals remain oriented toward a role definition that is largely decoupled from success criteria and standards whose achievement would support education reform goals. This orientation is further reinforced by principal recruitment, selection, preparation, and training practices that are similarly decoupled from the espoused goals of the education system (Hallinger, 2018b). While this conclusion may seem harsh, it aligns quite closely to Meyer and Rowan’s (1977) conceptualization of school’s as “institutionalized organizations”. As institutionalized organizations, schools are perceived as “successful” when they mirror stakeholder expectations for what schools *should look like*, regardless of actual performance. In institutionalized organizations, performance is defined by process criteria rather than evidence of outcomes. This emphasis on the face that can be seen fits well with the broader social norms of Thai culture.

Three policy implications arise from the analysis. First, efforts should be made to define and disseminate a new set of professional standards for the principalship that is consistent with the nation’s education reform goals. Second, as suggested above, there needs to be a better alignment of system processes for recruitment, selection, and training of principals to national goals. Third, efforts should be made to develop an award and recognition system that draws on relevant, reliable data linked to authentic growth toward the goals of student capability, morality, and satisfaction. In a nation where the urban-rural achievement gap has become a threat to social stability, awards should target principals who have made significant contributions to their schools in rural and disadvantaged contexts.

In terms of research, we feel that the review's initial inquiry into what is meant by "successful schools principalship" in the Thai context remains incomplete. Our review concluded that the fundamental processes which guide the Thai education system in practice, and which shape the expectations for principals, are largely decoupled from the espoused educational goals. Research should be conducted that elicits stakeholder expectations of Thai schools and principals in a more explicit way.

This research also prompts us to inquire more deeply into the "indigenous" leadership practices (Bajunid, 1996) of Thai principals. Our analysis suggested that the enactment of successful leadership and management practices is clearly influenced by Buddhist principles. Successful Thai principals meet cultural expectations by preserving harmony, kindness, and face, while seeking to gain and sustain the cooperation of teachers. Qualitative research is needed that inquires into how Thai school leaders enact leadership practices that meet the cultural expectations of stakeholders while also adapting to international education norms and standards that emphasize competition and performance outcomes. These are important questions that lie at the nexus of research, policy, and practice that we hope scholars will take up in the coming decade.

Introduction

It is not surprising that educational leadership and management (EDLM) including school leadership practices have become, and continue to be, buzz words in Arab-speaking countries in general and the Gulf Cooperation Council (GCC) countries in particular (Bailey et al., 2021; Hallinger and Hammad, 2019). In Oman, school leadership was given tremendous responsibility for resolving the long-standing problems of the inequitable student learning outcomes in the schooling system (Al-Mahdy and Emam, 2018). As a result of the precipitated changes that took over school leaders' practiced role in Oman in the last two decades, new policy mandates, new standards, and new demands for accountability have given a thrust to connecting school leadership practices to finding answers to big educational questions that have remained chronic problems in the educational system. These questions center around significant issues including reducing the achievement gap in general and gender achievement gap in particular (Al Jabri et al., 2018; MoE, 2018), evidence based strategies to achieve adequate yearly progress (Al-Shehhi et al., 2019), enabling diverse learners to access the curriculum including those with special educational needs (Al-Mahdy and Emam, 2018; Emam and Al-Mahdy, 2020), keeping a balance between efficiency and effectiveness (Al-Farsi, 2017), sharing leadership responsibility to develop a community of practice in which all teacher are engaged (Al-Harthi and Al-Mahdy, 2017), and finally, retaining teachers in jobs to prevent teacher turnover and retaining students in the classroom (Al Balushi et al., 2014; Al-Farsi, 2017) to prevent drop-out (World Bank Report, 2012; Education Council, 2020).

A recently conducted systematic review on school leadership models in educational research indicated that certain models have received increasing attention by researchers in different contexts. These models include distributed leadership, instructional leadership, and transformational leadership (Gumus et al., 2018) and ultimately argue for the best leadership style or the true leader who will establish the ideal leader-follower relations in school (Furman, 2012). Similar to any other part in the world, Arab countries including GCC countries and Oman focused on research that could help constructing a meaningful understanding of true school leadership. In their review of 48 article on the EDLM in the Arab region since 1990 Oplatka and Arar (2017, p. 267) stated that almost all research studies centered on identifying leadership styles and "the barriers faced by educational leaders in applying some of the leadership models originated in Western scholarship or on exploring and examining leaders' managerial perceptions and practices both in times of routine and reforms".

Islam, as a religion, is based on trusting the authenticity of Islamic leaders. Trustworthiness, from the Islamic leadership perspective, implies that a leader is expected to exert his/her efforts to guide and treat his/her followers justly. Additionally, the authenticity of an Islamic leaders is displayed to followers when the actions and practices of leadership serve the context and the support the followers to develop. Given that Oman's culture is informed by Islamic religious practices at home, we expect that teachers are likely

to search for authenticity in their school leaders and endorse it as their preferred leadership style, assuming that authentic leadership is likely to support work engagement. It could be argued, therefore, that the contextual Islamic cultural and social practices in Oman may accentuate authentic leadership practices in school and affect teacher engagement and teacher turnover intention.

In essence, the aim of the current article is twofold: (1) to contextualize the cultural, national, sociological aspects of school leadership in Oman, (2) report the results of an empirical study which explored how authentic leadership impact on teachers' engagement and turnover intentions in Oman.

School leadership in Oman: a synopsis

The Sultanate of Oman celebrated 50 years of the establishment of its modern integrated educational system which began in 1970 as Sultan Qaboos took over the throne. Oman is one of the GCC Arab-speaking countries, bordered by the United Arab Emirates, Saudi Arabia, and Yemen. In 2019, the estimated population of Oman was 4.84 million, of which expatriates represent proportionate number (1706 million), (Oman Population, 2020). The Human Development Report of 2019 indicated that Oman is a case example of the fastest progress countries in the Human Development Index. In the last three decades, Oman has risen from a poor to a rich country. This was indicated by high gross enrollment literacy rates, high income per capita, and an increase in life expectancy. In the realm of education, Oman achieved 100% access to basic education, and between 80 and 90% of them proceed to post-basic education. The progress that the educational system in Oman has made to date has been recognized in several international reports (World Bank Report, 2012; Human Development Report, 2019).

Historically, the educational system in Oman did not include any reference to school leadership until 1970s, which witnessed the beginning of the Renaissance age as His Majesty Sultan Qaboos took over the throne. Before 1970s, the sultanate of Oman had a primitive form of schooling informed by the religious culture in which learning to read and recite Quran was the ultimate goal of each family. During the early years of schooling, school leadership was embodied in the religious Imam. The paradigm-shift from schools of Quran to a typically modern school system began rapidly in the 1970s. Initially, there were a few schools, with a total of 196 schools across the country. With the increasing demand for new schools to enhance and support the expansion of the basic education system in 1997/1998, the number of school principals increased as the number of schools have increased. In 2011, the number of school principals and deputy principals was 1498. Gradually, this number increased 5% in 2019 to reach 1578 (MoE, 2019).

Oman has always adopted a centralized educational system. Therefore, the role of school principals has been to ensure the implementation of the rules and regulations envisioned a dictated by school policy makers (Al-Mahdy et al., 2018; Al-Mahdy and Emam, 2018). Culturally, school principals are perceived with appreciation and respect by the Omani society. As a result of having a central management system of schools, school principals' capabilities are mostly limited to move forward to solve complaints and challenges (Emam and Al-Mahdy, 2020). In response to his Majesty's speech in which he evaluated and reviewed Oman's educational system in 2010, and in response to World Bank Report in 2012, tremendous efforts were made to improve school leadership practices. In 2013, For example, Oman's Ministry of Education and New Zealand Education Consortium carried out an evaluative research project to review the educational system. The project focused on evaluating several aspects such as governance and management, financial affairs, student learning, teachers, school culture, curriculum, alignment between labor sector and educational system response. Findings revealed that the MoE is has mandated that in order to develop the quality of the educational system, priority should be given to enhancing and developing school leadership that could ensure school accountability (New Zealand Education Consortium, 2017).

In Oman, school leadership has been associated with increasing school effectiveness as it influences how members of an organization (e.g., schools) function (Al-Harthi and Al-Mahdy, 2017). The MoE, therefore, gave considerable attention to school leadership recognizing its importance in developing a functional system which would ensure school effectiveness and improve student learning outcomes. The MoE also introduced the Certificate of School Management in collaboration with Sultan Qaboos University. The certificate was a two-year endorsement program which targeted school principals of elementary schools. The program continued for 11 years from 2003 to 2004 to 2014 to 2015. In 2014, the Ministry of Education in Oman established the Specialized Institute for Professional Training of teachers (SIPTT) in an attempt of create an atmosphere and a platform where educational leaders will exhibit their efforts and celebrate their achievements (New Zealand Education Consortium, 2017). The establishment of the SIPTT was also seen as a major step taken by the MoE to address the needs of the educational system following the failure resulting from Oman students' low performance on international assessments such TIMSS and PIRLS (Al Shabibi and Silvennoinen, 2018; Al-Shehhi et al., 2019; MoE, 2018).

Despite the fact that there have been national initiatives that focused on enhancing school leadership (Al-Harthi and Al-Mahdy, 2017; Al-Mahdy et al., 2016) there has been little research that investigated the effectiveness of school leadership practices as perceived and envisioned by teachers and/or school leaders. We searched scientific databases and electronic resources (e.g., Scopus, PsycInfo, EBSCO, Sage Publications, Taylor and Francis, Science direct) to locate research studies which were conducted on school leadership in Oman. We located only 4 studies which examined school leadership practices in Oman (Al-Mahdy et al., 2016; Al-Harthi and Al-Mahdy, 2017; Al-Mahdy and Emam, 2018; Al-Mahdy et al., 2018). Al-Farsi (2007) investigated headteachers' perceptions of leadership role and found that the majority of them emphasized the importance of some aspects of leadership including having a shared school vision, giving teachers the opportunity to engage in teamwork, preparing an adequate school climate for work, commitment to the school, sharing leadership with teachers and delegating power. In another study, principal instructional

leadership was found to contribute to the commitment of their teachers directly through active instructional leadership practices. In addition, it also contributed to teacher commitment indirectly by influencing the collective efficacy of school teachers. (Al-Mahdy et al., 2018). The qualitative inquiry based on the data collected in the evaluation study by the New Zealand Education Consortium in 2013 in collaboration with the MOE concluded that school principals and teachers expressed lack of enthusiasm and having low morale because they felt dissatisfied with their job for various reasons (New Zealand Education Consortium, 2017). In a recent review of the leadership studies which were conducted in GCC countries and published in Arabic journals, Hammad et al. (2020) searched Arabic databases and found a total of 272 studies on EDLM written in Arabic language, 12% of which were conducted in Oman. The majority of the studies were published in the Kingdom of Saudi Arabia.

Authentic leadership

Authentic leadership implies the consistent display of explicit leadership behaviors that encourage positive psychological and ethical atmosphere with the aim of promoting self-awareness, internal moral perspective, balanced information processing and transparent communication with employees (Nasab and Afshari, 2019; Gatling et al., 2016; Azanza et al., 2015; Walumbwa et al., 2008), which makes it suitable for educational institutions (Duignan, 2014). Based on reviewing the literature, definitions of authentic leadership refer to main core components. The components include self-awareness (SA), relational transparency (RT), balanced information processing (BIP) and internal moral perspective (IMP) (Neider and Schriesheim, 2011; Walumbwa et al., 2008). The first component of SA refers to leaders' self-understanding of their strengths and weaknesses as well as of their temperament and character. The second component of RT indicates the leaders' ability to show evident communication of themselves and their genuine self to their followers. The third aspect of BIP is crystalized in providing unbiased information and less self-centered knowledge to the followers. The fourth component IMP refers to putative and genuine moral behaviors, values as well as adequate self-regulation (Neider and Schriesheim, 2011; Oh et al., 2018). The four components, arguably, may have certain degree of importance. In the field of education, SA, for example, was ranked as the highest feature used by leaders as perceived by the teachers, followed by BIP, RT and IMP respectively (Kulophas et al., 2018).

In general, studies on authentic leadership focused on investigating its relation to employees in terms of job satisfaction (Hitchcock, 2019), trust (Ahamed et al., 2013), engagement (Alazmi and Al-Mahdy, 2020; Oh et al., 2018; Ahamed et al., 2013), performance (Nasab and Afshari, 2019; Kim, 2014), turnover intention (Oh and Oh, 2017; Qureshi and Aleemi, 2018; Azanza et al., 2015; Gatling et al., 2016), academic optimism (Kulophas et al., 2018), commitment to organizations (Gatling et al., 2016) and self-efficacy (Kulophas et al., 2018; Kim, 2014). Scholars who examined authentic leadership in different contexts identified an array of characteristics and skills of authentic leaders. These include the ability to create a positive relationship with employees (Oh and Oh, 2017), the desire to provide learning opportunities and psychological support to their subordinates and retain human capital in the organization (Qureshi and Aleemi, 2018), being emulated as role models, display of morals, confidence, knowledge, optimism and resilience, serving their subordinates through increasing confidence, reducing burnout, enhancing followers' work engagement, and placing value on each person in the organization, and promoting hope, trust and positive emotions (Qureshi and Aleemi, 2018; Azanza et al., 2015). Accordingly, it has been argued that such characteristics of authentic leadership are necessarily needed in the educational settings as and that training school principals and deputy principals on authentic leadership would help them disseminate positive energy for more engaging and productive schools, and high-quality outcomes for future students (Kulophas et al., 2018).

Given that there have been proliferated efforts in Oman to highlight the role of school leadership the teacher's professional attitudes and career decisions, the leadership style of the school leaders becomes essential to examine. Although there is an array of leadership styles that have been examined in Oman, we found no records of examining authentic leadership. Our choice of investigating the impact of authentic leadership on teacher engagement and turnover intentions is based on its congruence with the cultural and religious practices in the Omani society, and therefore are inseparable from the educational and professional practices within the school context. In schools, an authentic leadership is the one whose behaviors explicitly support teachers to self-evaluate their performance against the intended goals set up by the MoE and communicated by the school leaders. Teachers trust the morals by which the school leader abides in his behaviors and decisions. Teachers also connect between the school principal's authentic leadership style and his commitment to Islamic values and believe that both are congruent with no discrepancy that could lead to a distorted message.

Teacher engagement

One of the essential factors affecting employers and employees in any workplace is work engagement. Taking school as an example, school leaders often rely on hard working teachers, who display commitment through taking responsibility and engage with the demands of the work environment. Within the collective culture in Oman and in congruence with the instruction of Islam, a leader needs truthful and honest subordinates similarly as the prophet Mohamed had companions that supported him and defended his call for Islam. Teachers showing work engagement are important resources for school leaders at times of crisis management. Work engagement focuses on the work itself and it is about the extent to which teachers are immersed and involved in their duties to achieve the school vision, mission, and intended outcomes. Additionally, work engagement in school focuses on job resources

such as autonomy, safety, and school support from school leaders and teacher interchangeably (Kim, 2014). Notably, work engagement was first investigated in relation to the effectiveness of business organizations (Kim, 2014; Oh et al., 2018), delivery of health care services (Qureshi and Aleemi, 2018) and education settings (Al-Farsi, 2007; Kulophas et al., 2018). From this perspective, work engagement has been examined as a direct or indirect outcome of different leadership styles and practices such as charismatic, transformational, and AL (Azanza et al., 2015). Leaders—who are seen as key drivers of subordinates' work engagement—perceive that work engagement is an instrument for retaining employees (Azanza et al., 2015). Alternatively, some scholars argue that leaders who display authenticity in their leadership and establish strong bonds with employees are most likely to affect their work engagement, i.e., work engagement is an outcome of positive leadership practices (Oh and Oh, 2017; Oh et al., 2018).

In school terms, work engagement implies that teachers have work positive state of mind and a motivational texture that is characterized by three main components: vigor, dedication and absorption (Oh et al., 2018; Azanza et al., 2015; Schaufeli et al., 2019). The first element, *vigor*, relates to having eminently motivated teachers with a willingness to invest their efforts to the teaching and other school related tasks. The second element, *dedication*, refers to being committed, enthusiastic, and caring to one's work and expected outcomes. The final element of work engagement is *absorption* and it refers to the state of being totally immersed in the work, showing happiness with overall work and task contexts (Kim, 2014; Kulophas et al., 2018; Oh et al., 2018).

There is evidence of significant interconnected relations between work engagement and other variables such as employees' occupational self-efficacy and role-based performance, employees' interpersonal trust (Kim, 2014), team work, job satisfaction, turnover intention, work group identity, authentic leadership (Azanza et al., 2015; Alazmi and Al-Mahdy, 2020), work core values (Qureshi and Aleemi, 2018; Oh et al., 2018) and teachers' academic optimism (Kulophas et al., 2018). The aforementioned relationships are predominantly positive, and in some cases negative as in the case of employees' turnover intention (Azanza et al., 2015). Work engagement is perceived as vital mediation mechanism between an array of variables including interpersonal trust and role-based performance, occupational self-efficacy and role-based performance, leadership and organizational citizenship behavior (Kim, 2014). Additionally, it partially mediates the relationship between authentic leadership and turnover intention (Azanza et al., 2015). In a study by Oh et al. (2018), variables served as mediators in the relations between work engagement and other variables such as practicing core values. In Thailand TE was found to result in meeting daily challenges by boosting teachers' immersion in school tasks, thereby enhancing their self-efficacy (Kulophas et al., 2018). Teacher's engagement in Oman implies involvement in school related administrative and academic tasks, negotiating how they can make right decisions on a daily basis to achieve the short and long-term goals in the areas of academic achievement, social and emotional learning, and cultural values acquisition. Al-Farsi (2007), for example, has indirectly investigated teacher's engagement by exploring how teachers are involved in teamwork in school. Based on interviewing headteachers in Oman, Al-Farsi (2007) indicated that head teachers stressed the importance of engaging teachers in some management roles with the aim of gaining teachers' support and decreasing the managerial demands. It was noted, however, that some teachers may refuse to play an administrative role due to the teaching workload, which could also lead to teacher turnover (Al Lawati, 2014).

Teachers turnover intention (TTI)

TTI refers to a voluntary proposed mental plan of an individual to search for a new job, leave or quit the current job as a result of various personal, psychological, contextual reasons (Mobley et al., 1979; Azanza et al., 2015; Qureshi and Aleemi, 2018) such as age, gender, education, attitude, intrinsic motivation, salary, promotion, the work itself, amount of work and the relationship with superiors (Mobley et al., 1979). Thus, the willingness to actual turnover process is predicted through the individual's intention to leave the job (Mobley et al., 1979; Oh and Oh, 2017; Qureshi and Aleemi, 2018).

TTI has attracted the interest of scholar in management, psychology and sociology (Azanza et al., 2015; Oh and Oh, 2017; Qureshi and Aleemi, 2018). More specifically, jobs with high rate of psychological burnout were the focus of Turnover Intention investigations, including hospitality (Gatling et al., 2016), nursing (Qureshi and Aleemi, 2018), education (Al-Mahdy and Alazmi, 2021; Hitchcock, 2019), and private and general business sectors (Azanza et al., 2015; Oh and Oh, 2017) in different countries (USA, Pakistan, Spain, Korea, Kuwait). Generally, TTI has been related to leaders' leadership style, organizational commitment, organizational performance and job satisfaction, thus throwing the ball in the manager's court (Al-Farsi, 2007; Kim, 2014; Azanza et al., 2015; Gatling et al., 2016). This association perhaps meant that positive healthy relationships, increased job satisfaction, higher level of engagement and greater retention rate or decreased burnout level reflected quality management and leadership skills (Kim, 2014; Qureshi and Aleemi, 2018; Hitchcock, 2019). In education, this argument implies that when new teachers take their teaching jobs, their satisfaction could predict their current of future intention to stay in their job (Hitchcock, 2019; Al-Mahdy and Alazmi, 2021), i.e., teachers' job satisfaction "has the advantage of reducing the cost associated with teacher turnover" (Al-Mahdy et al., 2016, p. 547). A number of studies pinpointed the variables that could curb employees' turnover intentions. Authentic leadership, for example, has been found (Gatling et al., 2016; Qureshi and Aleemi, 2018) to have an indirect negative effect on employees' turnover intention, but not the opposite. In addition, it has been found that organizational commitment is negatively connected to turnover intention and that lack of commitment leads to increased job search behavior and intention to leave (Gatling et al., 2016). Another finding indicated that employees' levels of affective commitment had a negative effect on turnover intentions and that authentic leadership had a similar effect when organization size was small to moderate (Oh and Oh, 2017). Furthermore, Azanza et al. (2015) found that the higher the employees' work engagement the lower their intention to leave their profession. Additionally, the results showed that age was negatively related to turnover intention.

In a country like the United States, shortage of qualified teachers and high teacher turnover rate emerged as a result of social context-related aspects including the increasing number of schools in poor and distant areas. Consequently, it was difficult for remote schools to develop model teaching practices and build good collaboration with parents and the local community (World Bank Report, 2012). This was typically the case in Oman where novice teacher who took their jobs in remote rural schools were likely to leave the job very soon if their wish for transfer to main city schools was not granted. This led to having less experienced teachers and expats teaching in those schools (World Bank Report, 2012).

In the Omani context, there have been several construed reasons behind teachers' intention to leave the teaching (AL-Neimi and Amzat, 2012; Al Balushi et al., 2014; Al Lawati, 2014). First, TTI may be due to environmental factors such as school size, location and school gender type and double shift-time (morning or afternoon school time) (Al Balushi et al., 2014). Second, teachers may not stand the workloads of teaching compared to the insufficient salary they are paid (AL-Neimi and Amzat, 2012). Third, it was argued that teacher–principal relationship may actually affect the teacher's decision to leave the job. Al Lawati (2014) conducted a semi-structured interview with teachers and found that teachers have the intention to quit their jobs as a result of working with uncooperative school principals. Al Lawati (2014) noted that the majority of teachers, however, may consider turnover, but most of them request to transfer to other schools before they take a final decision to actually leave the job (Al Balushi et al., 2014). Although the annual Statistics Handbook that is released by the MoE provides information on different aspects of the educational system including student dropout rate, there is no specific section on teacher turnover intention or a count of those who actually left the teaching job. To date, there is no particular study that focused on TTI in relation to school leadership in Oman, thus, providing value to the current investigation.

The relationships among authentic leadership, teacher engagement and teacher turnover intention

The relationship between authentic leadership, teacher engagement and TTI has not been studied altogether in one study, although paired relationship of the three were investigated in different recent studies (Kulophas et al., 2018; Gatling et al., 2016; Oh and Oh, 2017; Oh et al., 2018). Two studies by Qureshi and Aleemi (2018) and a study by Azanza et al. (2015), however, investigated the effect of authentic leadership on turnover intention as mediated by work engagement in different sectors such as health, education, and administration. Surprisingly, most research studies on the relationship between the three were mainly investigating the effect of authentic leadership on both turnover intention and work engagement. These studies concluded that authentic leadership has a significant effect on TTI and work engagement.

In short, there is a dearth of research examining the relationships among authentic leadership, teacher engagement, and TTI in Arab speaking countries in general and in Oman in particular. Although there are several studies that were conducted on these variables in Western countries but studies in Arab countries are at an early stage. The present study, therefore, is an attempt to explore the effect of principal authentic leadership on TTI, with a particular focus on the mediating role of teacher engagement in the context of Oman. Specifically, this study aims to answer the following three questions:

- Does principal authentic leadership significantly affect teacher turnover intention?
- What is the impact of teacher engagement on teacher turnover intention?
- Is there a mediation effect of teacher engagement on the relationship between principal authentic leadership and teacher turnover intention?

Method

The data reported in this article was drawn from a larger dataset of a research project that examined school leadership in Oman. The data was collected using a cross-sectional research design, structural equation modeling (SEM) to investigate the relationships which were indicated in the aforementioned research questions. In this section, we describe our variables and measures, procedures for collecting, analyzing, and reporting the data.

Data collection

Data were collected using a convenient sampling technique. We approached a large number of teachers in basic education middle schools (grades 5–10) in the biggest city of the Sultanate of Oman either by email or by visiting schools. Over two months during the spring semester of 2020. We sent an invitation letter, consent form and scales package electronically to teachers, requesting their participation in the survey. 398 teachers agreed to take part, this number exceeded the desired accuracy for a confidence level of 95% (Gill et al., 2010) and was sufficient to meet the minimum sample size recommended ($n = 200$) for running SEM (Kline, 2011). Of them, 224 were female (56.3%) and 174 were male (43.7%). The amount of teaching experience in the sample ranged from 1 to 27 years, with an average of 12.08 years ($SD = 5.26$). Approximately 11.3% of the participants had 1–5 years of teaching experience, 25.4% had 6–10 years of experience, and 63.3% had more than 10 years of experience.

Instruments

Principal authentic leadership (PAL)

Walumbwa et al. (2008) developed the authentic leadership questionnaire (ALQ) to measure managers' authentic leadership. Indeed, the ALQ is one of the most widely used measures of authentic leadership (Gardner et al., 2011). Although Neider and Schriesheim (2011), indicated some concerns with the ALQ but they used the same four dimensions of the ALQ, namely: self-awareness (SA), relational transparency (RT), balanced information processing (BIP) and internal moral perspective (IMP) to suggest an alternative inventory, Authentic Leadership Inventory (ALI). To limit the length of the questionnaire, the current study adopted the item selection approach for building a short-version scale used by some researchers (Alazmi and Al-Mahdy, 2020; Gillespie and Mann, 2004). One item with the highest factor loading on each dimension of the original ALQ (Walumbwa et al., 2008) and that included in the ALI (Neider and Schriesheim, 2011) was chosen to build a 4-items short form. The four items are My principal: "demonstrates beliefs consistent with their actions" (IMP); "seeks feedback to improve interactions with others" (SA); "says exactly what he or she means" (RT); "solicits views that challenge his or her deeply held positions" (PIB). Cronbach's alpha for the Arabic version of the 4-item short form was $\alpha = 0.94$.

Teacher turnover intention (TTI)

TTI was measured using 3-items theorized by Mobley et al. (1978) and found (e.g., Miller et al., 1979) to be important precursors to turnover: *thinking of quitting*; *intention to search*; and *intention to quit*. This measure has been widely used, with evidence of reliability and validity ($\alpha > 0.80$; e.g., Carmeli and Gefen, 2005; Cohen and Golan, 2007). The 3 items which comprise the TTI are: (1) "I think a lot about leaving my job", (2) "I am actively searching for an alternative to my job", and (3) "as soon as possible, I would leave my job". The α coefficient for this scale in current study was 0.89.

Teacher engagement (TE)

TE was assessed using a short-version of the Utrecht Work Engagement Scale (UWES) developed by Schaufeli et al. (2019). This scale features 3 items (UWES-3) which are: (1) "At my work, I feel bursting with energy" (vigor); (2) "I am enthusiastic about my job" (dedication); (3) "I am immersed in my work" (absorption). The Cronbach's alpha for UWES-3 was $\alpha = 0.93$ in our current investigation.

All items were rated using 1–5 Likert scales, with 1 representing a low rating, and 5 being high. Although each of these instruments has undergone extensive testing of psychometric properties in previous research, the current study tested the measurement properties using an Arabic translation of the three instruments to validate their use in the Omani context. The authors followed Brislin (1970) backwards translation method to translate the surveys from English to Arabic. We had to rephrase some items to ensure their suitability for Omani educators, but without altering their original meaning.

Data analysis

In this study, a two-step structural equation model approach was employed (Byrne, 2010; Hair et al., 2010). The Analysis of Moment Structures (IBM AMOS) version 22 was used to assess the validity of the measurement model, followed by examination of the structural model. Confirmatory factor analysis (CFA) was used to assess the validity of the measurement model by testing the construct, discriminant, and convergent validity of the scales. We used cut-off criterion of 0.60 for factor loading (Chin et al., 1997; Hair et al., 2010). Interpretation of the magnitude of standardized effect sizes (β) was informed by Cohen (1992) (i.e., 0.10–0.30 small effect, 0.30–0.60 moderate effect, >0.60 large effect).

A number of indices were used to indicate the robustness of fit, including Chi-square/degrees of freedom ratio (χ^2/df), Root Mean Square Error of Approximation (RMSEA), the Tucker–Lewis Index (TLI), Normative Fit Index (NFI) and the Comparative Fit Index (CFI). According to Schreiber et al. (2006), data fit is excellent when TLI, NFI, and CFI are greater than 0.95, and is acceptable when TLI, NFI, and CFI are no less than 0.90; for RMSEA, an excellent data fit requires it to be less than 0.06, and an acceptable fit requires it to be under 0.08.

Results

Preliminary analyses

Table 1 shows each variable's descriptive statistics, internal consistency estimates, and correlational coefficients. Descriptive statistics suggested that teachers in Oman perceived their principals to be highly authentic leaders ($M = 4.00$; $SD = 1.04$); teachers also perceived the existence of higher levels of teacher engagement ($M = 3.90$; $SD = 1.16$) and moderate levels of teacher turnover intention ($M = 2.83$; $SD = 1.45$). Regarding the normality of the variables, skewness ranges between 0.171 to -1.20 and kurtosis ranges between 0.075 and 1.383, indicating that the current data meet the assumption of a multivariate normal distribution (the standard skewness >3 and the standard kurtosis >10) (Kline, 2011). Regarding scale reliability, all measures indicated acceptable level of internal consistency estimates (Cronbach's α values ranging from 0.89 to 0.94), and the correlation coefficient estimates among the research variables (ranging from 0.230 to 0.586) were at a moderate statistically significant level. Also, all of the relationships between the variables were small enough to avoid the risk of multicollinearity >0.90 (Hair et al., 2010). While self-report surveys

Table 1 Descriptive statistics, convergent & discriminant validity.

Construct	$\bar{x}$	SD	α	AVE	1	2	3
Principal authentic leadership	4.00	1.04	0.94	0.788	<i>0.888</i>		
Teacher turnover intention	2.83	1.45	0.89	0.728	−0.230**	<i>0.853</i>	
Teacher engagement	3.90	1.16	0.93	0.809	0.251**	−0.586**	<i>0.899</i>

Notes: five-point Likert scale; teachers, $n = 398$, ** $p < 0.01$, diagonal elements in italics are the square root of AVE.

could cause a common method variance problem in the current study, the Harman's single factor test result indicated no dominant factor emerging from the factor analysis. PAL accounted for 33.64% of the variance, whereas teacher engagement and TTI accounted for 28.89% and 25.52% of the variance respectively (Podsakoff et al., 2003).

We, then conducted Confirmatory Factor Analysis (CFA) using AMOS v.22.0 to examine the one-factor structure of the PAL, teacher engagement, and TTI. The CFA results indicated an excellent data fit for PAL model, ($\chi^2/df = 1.083$, CFI = 1.000, NFI = 0.998, TLI = 1.000, RMSEA = 0.014) with factor loadings for observed PAL items ranging from 0.86 to 0.92. For the TTI scale, the CFA results indicated an excellent data fit for the TTI structure ($\chi^2/df = 1.818$, CFI = 0.999, NFI = 0.997, TLI = 0.998, RMSEA = 0.045) with factor loadings for observed items ranging from (0.92–0.95). For teacher engagement, the CFA results reflected an acceptable fit ($\chi^2/df = 2.964$, CFI = 0.998, NFI = 0.997, TLI = 0.994, RMSEA = 0.070), with factor loadings of observed items ranging from 0.88 to 0.91.

We also assessed the convergent and discriminant validity of the instruments. We determined convergent validity by examining the Average Variance Extracted (AVE) statistics. As shown in Table 1. The AVE values for the three instruments were 0.788 (PAL), 0.728 (TTI), and 0.809 teacher engagement. All values exceeded the criterion of 0.50, thereby demonstrating adequate convergent validity (Hair et al., 2010). We assessed discriminant validity by comparing the square root of the AVE statistics with correlations among the latent variables. Table 1 shows that the AVE square root values for each construct were greater than the correlations between latent constructs. These results support the overall validity of the proposed conceptual model (Hair et al., 2010).

Assessment of the structural model and mediating effect

As mentioned, the focus our investigation was to explore the relationships between principal authentic leadership, teacher engagement and teacher turnover intention. Due to the strength of analyzing the complex relations among multiple latent variables simultaneously and controlling for measurement error, SEM using the Amos 22 was used to examine the influence of principal authentic leadership (PAL) on teacher turnover intention (TTI) and the mediation effect of teacher engagement. With regard to the mediation effect of teacher engagement we followed the procedure suggested by Baron and Kenny (1986) and other scholars (e.g., MacKinnon and Fairchild, 2009). Accordingly, two conditions were required for the test of mediation. First, the mediator should be significantly related to both the independent and dependent variables. Second, the mediator should significantly impact upon the dependent variables. Two SEM models, therefore, were tested to examine the relationship between PAL, TE and TTI. The first one (model A) was the direct effect model in which PAL was hypothesized to predict TTI. SEM results for this model showed good data fit ($\chi^2/df = 1.376$, CFI = 0.998, NFI = 0.992, TLI = 0.996, RMSEA = 0.031). The value of model A is shown in parentheses in Fig. 1.

The results of model B are shown in Fig. 1 and its values are shown on the figure line. According to model B, PAL had a significant positive effect on teacher engagement ($\beta = 0.25$, $p < 0.001$). While teacher engagement showed a significant negative effect on TTI ($\beta = -0.56$, $p < 0.001$), its inclusion as a mediator between PAL and TTI resulted in decreasing the regression coefficient of PAL ($\beta = -0.09$, $p < 0.064$), making it insignificant. Thus, TE fully mediated the relationship between PAL and TTI. The model B fit was excellent as indicated by various fit indices ($\chi^2/df = 1.905$, CFI = 0.991, NFI = 0.981, TLI = 0.987, RMSEA = 0.048).

Discussion

In the current article we highlighted school leadership research and practice in Oman, a context which is underrepresented in school leadership literature. We provided empirical data which explored the association between principal authentic leadership and teacher turnover intention and how teacher engagement may affect such relationship in Omani schools. The findings of our investigation pinpoint certain ideas that warrant discussion. Primarily, our empirical results showed that teachers who responded to our survey in Oman perceived their school principals as authentic leaders ($M = 4.00$; $SD = 1.04$). They also perceived themselves as highly engaged with school life activities ($M = 3.90$; $SD = 1.16$). These findings align with similar findings by Kulophas et al. (2018), who reported high engagement by school teachers in Thailand. The main finding about our empirical research questions indicated that principals' authentic leadership has is associated with a decrease in teachers' retention intentions. This result is consistent with other findings from other contexts (Gatling et al., 2016; Oh and Oh, 2017; Azanza et al., 2015; Qureshi and Aleemi, 2018; Kulophas et al., 2018) which emphasized that authentic leadership creates a buffer zone for employees who may consider quitting their jobs. Similarly, Oh et al. (2018) found a positive relationship between PAL and work engagement.

$$\chi^2=60.945; df=32; p=.002; CFI=.991; NFI=.981; RMSEA=.048; TLI=.987$$

Fig. 1 Teacher engagement as a mediator between PAL and TTI (model B). Note: Model (A) value is shown in parentheses.

The second research question investigated the impact of teacher engagement on their intention to leave the teaching profession. The teacher engagement was conversely associated with TTI ($p < 0.001$). This indicates that teacher engagement reduces turnover intentions. Similarly, Azanza et al. (2015) found a reverse impact of engagement on TTI, i.e., the higher the engagement at work, the lower the turnover intentions. In answering the third question, we examined the role of teacher engagement as a mediator between PAL and TTI. When we tested the mediational effect of teacher engagement on the association between PAL and TTI a full mediation was found. The inclusion of teacher engagement in the model made the association between PAL and TTI statistically not significant. This suggests that principal leadership influences teacher engagement, and that through teacher engagement, the principal authentic leadership is likely to reduce teacher's turnover intentions. This mediational effect of teacher engagement is in line with previous research. Azanza et al. (2015) found a mediational effect of teacher engagement on the relationship between authentic leadership and turnover intentions even though it was partial.

Overall, it could be argued that PAL contributes to teacher engagement in Oman. Engaging teachers in different roles and providing them with opportunities for continuous professional developments are essential for maintaining and sustaining school success (Hamad and Al Ani, 2016). This highlights the essential role of principals who are willing to succeed. Acting as authentic leaders is likely to help them convince teacher to engage to achieve school intended learning outcomes.

Our findings may be interpreted from the sociocultural perspective. Oman's culture which is informed by Islamic values has an impact on both individuals' professional roles in various contexts. Authentic leadership is often seen as a reflection of the trust in somebody who shows honesty, truthfulness, and genuineness to his followers in the same way the Prophet Mohamed was a role model for his followers (Aldaihani, 2020). Taken as such, school principals who advocate such characteristics, embrace transparency, and show intelligence and wisdom when leading their schools gain teachers' trust and contribute to teacher

engagement and affect teachers' turnover intentions. Perhaps this is true if we consider that in reality, the administrative system in Oman is characterized by high power distance due to centralism. School leaders tend to be the mouthpiece of decision makers and use their authority to ensure that mandates are implemented even though teacher may express discomfort. Therefore, leaders in Oman either become less integrative or embrace authentic leadership practices that paralleled with Islamic values.

Our investigation is not without limitations. First, our data was based on a randomly selected sample from the biggest city and capital of Oman. There are some cities that have different and special characteristics particularly in mountain areas. Samples from these areas need to be included in future studies. Also, this area is not preferred by the majority of teachers. Most of the teachers who are appointed in such areas leave pursue transfer to big cities and municipalities (Al Balushi et al., 2014). This was confirmed by the World Bank reports (World Bank Report, 2012). Second, we our investigation focused on testing the impact of on mediator, namely teacher engagement. Future investigations should include other possible mediators. Such as exposure to professional training on specific leadership practice in the Leadership Program by the SIPTT. This program has become compulsory for school principals and deputy principals to boost creating professional learning communities in Omani schools (Al Jabri et al., 2018). The program may have an impact of making school leaders authentic leaders and authentic practitioners. Third, our model needs to be tested again in other Arabic-speaking contexts to examine the bi-directional effects between the three variables of PAL, TTI, and teacher engagement. Finally, we relied on survey design to collection data, which has a common source variance. We relied on teachers' ratings of their school principals; future research could rely on multi-level modeling to assess separate effect at the individual (i.e., principals) and unit (i.e., school levels).

Conclusion

In the current article we highlighted school leadership in an Arab context, contextualizing the cultural, national, sociological aspects of school leadership practice in Oman, and provided empirical data on how teachers in Oman perceive authenticity in the school principals and how they perceive the effect of principal authentic leadership on teacher turnover intention. Additionally, we examined the role of teacher engagement in the relationship between principal authentic leadership and teacher turnover intention. The article argued that authentic leadership could be an effective leadership style that fits with the concept of Islamic leadership in Arab countries like Oman.

In Oman, authentic school principals have authentic values that are not compromised. Teachers trust authentic school principals because they display consistent behaviors, open communication, and empowering attitudes that enable teachers to achieve better outcomes at the personal, student, and school levels. They are those who understand that leadership is not about getting loyal teachers but about having empowered teachers and school staff. The study findings have important implications for Omani schools and for educational policy makers in Oman. First, authentic leadership is considered the blueprint of teacher engagement. Teachers feel empowered when they see authentic school principals. Training school principals on authentic leadership practices could be an important target for in-service training direct at school principals in Oman. Second, authentic leadership is close to the concept of Islamic leadership. Both center on having a leader that can build trust and that can transform his followers to authentic followers who can later lead others. School in Oman need this form of leadership particularly within the centralized system where teachers sometimes feel that they are just recipients of top-down decision and therefore, lack enthusiasm for taking actions or showing teacher agency for problem solving. Third, teacher turnover intention is a problem in Oman as it is in other places of the world. Perhaps one important finding of our investigation is the effect principal authentic leadership has on teacher turnover intention. When teacher see authentic models of leadership their engagement will increase, their intention to leave the job diminishes and they become determinant to have an effect on students and schools in which they serve. In summary, the investigation on authentic leadership in Oman could open a window for practitioners to discuss what it is that inspires teachers and make them possible authentic school leaders, thereby maximizing their influence in improving school effectiveness and student learning outcomes.

Acknowledgment

The data reported in this article is part of the research project that was funded by Ministry of Higher Education, Scientific Research & Innovation (MHECRI) (RC/RG-EDU/DEFA/19/01). The authors, therefore, would like to thank MHECRI for financial and technical support.

Introduction

Over the past 50 years, it has become clear that relationships are at the foundation of student learning and development (Hartup, 1989; Pianta, 1999; Jennings and Greenberg, 2009; Chong et al., 2018; Epstein and Mcpartland, 1976; Walberg and Anderson, 1968; Entwistle and Ramsden, 1982). Positive organizational studies can make a significant contribution to educational leadership practice because they illuminate the ways in which leaders' work strengthens relationships, leading to increased motivation, commitment, engagement, and effort, all of which are associated with achieving the goal of student development and learning (Murphy and Louis, 2018).

This increasingly robust line of inquiry draws on positive psychology, which emerged in the mid-1990s (Seligman and Csikszentmihalyi, 2000; Gillham and Seligman, 1999). The applications of positive psychology quickly spread to organizational and leadership research (Cameron et al., 2003; Cameron and Spreitzer, 2012), and its development also overlapped with the attention to emotions in work settings, including schools (George, 2000; Barling et al., 2000; Fredrickson, 2001; Hargreaves, 1998, 2002). It was also aligned with other emerging research on school leadership practices that emphasized the importance of positive relationships within organizations, including transformational leadership (Leithwood and Jantzi, 1990; Leithwood and Steinbach, 1991), democratic and participatory leadership (Furman and Starrett, 2002; Weiss and Cambone, 1994), culturally-relevant leadership (Maxcy, 1998; Khalifa, 2018), along with others who advocated for a refocusing of schools on moral purpose (Sergiovanni, 1992). In sum, a positive psychology perspective on school leadership is not a different way of thinking about the work of running a school, but an integrative framework that may best serve as an “umbrella” under which a variety of scholars whose work is complementary may find a common space.

What do we know? A brief overview of educational research

Each of the trends briefly described above points to a shift in the role of school leaders, away from a narrow interpretation of instructional leadership that focuses almost exclusively on tested academic performance of pupils and toward a broader perspective, leadership for learning, which implies an integration of academic focus and a relationship focus (Murphy, 2013; Leithwood and Riehl,

2005). Leadership for learning also implies a responsibility for developing a school-wide culture (or climate) that fosters both academic and social development (Bryk et al., 1998; Newmann et al., 1989; Leithwood and Riehl, 2005).

Student authentic learning and socio-emotional development requires more than an improvement in technically competent instruction (Newmann and Associates, 1996) and is affected by a variety of within-school social factors such as classroom climate, peer relationships, and academic emphasis. In addition, supporting better learning environments for teachers and students requires creating facilitative school conditions (Wu et al., 2012; Lee and Louis, 2019). Principal leadership, furthermore, has a significant relationship with the school conditions that are clearly associated with student learning and development, such as teachers' sense of collective efficacy, the faculty's capacity for collective organizational learning, and commitment (Lee and Shute, 2010; Leithwood and Louis, 2011; Day et al., 2016). Nowhere is this more critical than in schools in challenging circumstances, where more is needed and expected from a school because many students come from families whose lives are more uncertain and chaotic, often for reasons outside their control (Bryk and Schneider, 2002; Goddard et al., 2001; Khalifa et al., 2016).

For example, research has focused on building high-trust school settings as a precursor to schools that work for all teachers and children (Hoy and Tschannen-Moran, 1999; Tschannen-Moran, 2009), and we have also learned that trust only develops within positive relationships (Price and Moolenaar, 2015; Tschannen-Moran, 2004). Some empirical research focuses on general perceptions of teacher–principal relationships as supportive or stimulating, as well as trusting (Fox et al., 2015; Brezicha et al., 2015; Musah et al., 2018). Studies of what principals actually do to develop the kind of relationships that are linked to school climate and student development and learning are also emerging (Hollingworth et al., 2017; Walker et al., 2021; Handford and Leithwood, 2013; Bodunrin et al., forthcoming), and have been shown to affect students but and school innovation (Bryk and Schneider, 2003; Louis, 2007; Moolenaar and Slegers, 2010).

A parallel line of work has emerged around principal caring (Smylie et al., 2016, 2019a; Louis et al., 2016; Louis and Murphy, 2017; Schechter and Shaked, 2017; Lomotey and Lowery, 2015; Eldor and Shoshani, 2016; Murphy and Torres, 2014; Beck, 1994). Again, there is evidence across countries and subcultures within countries that school leaders who express caring for both adults and students are more effective in shaping the processes and outcomes. In particular, accumulating research suggests that caring principals are more likely to contribute to school climate and instruction that is culturally responsive and supportive for students whose race/ethnicity or socioeconomic status have marginalized them (Lomotey and Lowery, 2015; Khalifa, 2018; Tichnor-Wagner and Allen, 2016; Wilson, 2016). Like trust, principal caring means wanting the best for students which often requires improvements in students' school experiences, which reflects an improvement-oriented school culture (Louis and Murphy, 2017; Kurland et al., 2010; Blase and Blase, 2000).

What we know: some specifics about positive school leadership¹

Some who make the argument for the crucial link between a principal's behaviors and leadership for learning have focused on the role of what might be called "executive leadership functions" such as motivating others, developing strategic visions and supportive structures, and hiring the right people, most of which are derived from the literature on large corporations (Kouzes and Posner, 2006; Collins, 2009). In contrast, the current weight given to the principal's role in supporting teachers assumes that he or she will spend much time discussing instruction and learning with individual teachers—hands-on, interpersonal interactions that focus on improving work routines including, but not limited to, instructional leadership (Marks and Printy, 2003). Thus, an alternative perspective suggests the explicit importance of the daily work of management and interactions with others that help to establish a school's culture (Schatz, 2003). This paper elaborates one foundational element of positive organizational research with a deep empirical base: leader–member exchanges in daily work that reinforce patterns of networked relationships within teams and the school more broadly. It will point to both the building blocks of routine relational exchange and articulate their consequences for school improvement. There is an emerging agreement about some of the key building blocks: namely that positive school leadership is:

1. *Focused on relationships as the foundation for the work of schools.* This is, of course, not a new observation (Miskel and Ogawa, 1988), but it nowhere is this more visible than in recent collections of cases of individual schools and leaders (Walker et al., 2021; Smylie et al., 2020). When aggregated to the group, a relational culture provides the foundation for asset-based experiences for all members (Burrello et al., 2016). Extensive empirical research has focused on relational trust and building high-trust school settings as a precursor to schools that work for all teachers and children (Hoy and Tschannen-Moran, 1999; Tschannen-Moran, 2009), and we have also learned that professional trust develops within positive personal relationships (Price and Moolenaar, 2015; Louis and Murphy, 2017). Some empirical research focuses on general perceptions of teacher–principal relationships as supportive or stimulating, as well as trusting (Fox et al., 2015; Brezicha et al., 2015; Musah et al., 2018), and studies that focus on how specific principals' actions help to develop the kind of relationships that are linked to school climate and student development and learning are beginning to emerge (Hollingworth et al., 2017; Walker et al., 2021; Rhodes et al., 2009)²

¹Much of this section focuses on educational research. The more extensive non-school scholarship that underlies this article is reviewed in Murphy, J., and Louis, K.S., 2018. *Positive School Leadership: Building Capacity and Strengthening Relationships*, New York, Teachers College Press.

²We acknowledge the many excellent studies that use the Multifactor Leadership Questionnaire to examine the relationship between principal behavior and school improvement. However, most of these use factors that focus on transformational leadership constructs rather than the more specific elements of principal behavior that we emphasize here.

2. *Grounded in an ethical perspective* on the purpose of schooling (and of leadership). This is, of course, fundamental to those who study ethical and value-based leadership in schools (Rosenblatt and Peled, 2002; Stefkovich and O'Brien, 2004; Norberg and Johansson, 2007), but many other leadership scholars identify ethical and value positions and values as equally fundamental to school improvement (Leithwood, 1999; Cherkowski et al., 2015) and developing a relationship-based culture. As noted earlier, in many professions an ethic of care is a central feature of ethical leadership principles (Smylie et al., 2016). Even though the virtuous leadership literature is littered with inconsistencies, this perspective informs us directly that "*school administration is a moral art*" (Greenfield, 2004) (p. 183), that positive school leaders "are more likely than others to apply moral principles and virtues to the situation to make sense of what action to take" (May et al., 2003) (p. 254). Integrity is a central aspect of positive school leadership as is "making the needs and interests of others primary" (Cooper et al., 2005) (p. 487). Humanity, altruism, trust, and service are powerful items in the virtue toolbox of positive school leaders, while many authors who write about virtues in school leadership would include empowerment of others (Leithwood and Riehl, 2005). In reviewing the positive leadership literature, Murphy and Louis (2018, pp. 29–44) synthesize nine principles, which are: asset-based, value-centered, virtue-based, transcendent, relationally grounded, focused on means as well as ends, growth-based, authentic, and service-grounded.
3. *Supportive of identification and belonging*. This theme, which emerges in all positive organization scholarship, is expressed strongly in schools—in part because schools are obligated to deal with children's emotional and behavioral development as well as cognitive growth. In particular, identification and belonging are associated with commitment to the educational purpose of schools for all members (Chan et al., 2008; Allen et al., 2018). The scholarly literature defines organizational identification in a variety of ways, but they have much in common: a feeling of openness or belonging (Beck, 1994; Mayeroff, 1971; Riley, 2013c) and inclusion (Murphy, 2016; Gonzales, 2019; Sluss and Ashforth, 2008). It is also commonly seen as a product of reciprocal leader–member identification (Avolio et al., 2004), and as a catalyst for teacher commitment (Geijsel et al., 2003) and student achievement (Reynolds et al., 2017). The longer-term development of strong interpersonal bonds and group identity increase collaboration and the willingness to take on additional roles (Angelle and Schmid, 2007) which has consequences for grade level/department teams and professional learning communities.
4. *Empowering, consistently building both self and collective efficacy over time*. Principals who empower their teachers and students take advantage of the human capital that already exists and foster the further development of that capital. One of the most consistent findings in the positive leadership research is that productive leader–member relationships increase sense of efficacy (Murphy and Louis, 2018), and have both a direct and indirect (through sense of efficacy) relationship to teacher commitment and effort (Ross and Gray, 2006). There is also ample evidence that teachers who feel empowered in their relationships with their principal and peers are more likely to experience both individual and collective efficacy while teachers' capacity to work closely with their administrators is associated with commitment to teaching (Ware and Kitsantas, 2007; Kurt et al., 2011; Goddard and Salloum, 2012; Goddard et al., 2015).
5. *Developmental, promoting continuous authentic learning for all*. For students, this means engaging classes where they feel a sense of responsibility for their own learning. The ability of formal school leaders to have an effect on classroom experiences is largely indirect, through teachers who are committed to this type of instruction (Wahlstrom and Louis, 2008; Herrington et al., 2014), which means replacing the often dreaded "professional development days" with opportunities that allow choice and increase willingness to experiment and take risks, both individual and collectively (Spreitzer, 2008; Schuttinger, 2021; Rule, 2006). There is ample evidence that school leaders have a significant effect on individual experimentation, through "job-crafting" and action research (Blase and Blase, 2000, 2002). In addition, multiple studies establish the role of the principal in promoting conditions that stimulate organizational or collective learning (Leithwood et al., 1998; Marks and Louis, 1999; Brown, 1995; Geijsel et al., 2009; Youngs and King, 2002; Supovitz, 2009; Louis and Lee, 2016). For both new and experienced teachers, it means individualized support as well as professional learning communities (Louis et al., 2016).
6. *Affected by specific features of the context*. While there are clearly uniformities in how schools are organized in modern society, community and national/local cultures influence how positive leaders behave, what teachers need in order to thrive, and how students respond to adult behavior (Hallinger et al., 1990; Hallinger and Murphy, 1986). Because the human context matters, positive school leaders must be attentive to community, whether it is urban or rural, stable or rapidly changing. Positive school leadership requires attention to changes in the demographic composition of their students' families and renewed recognition of socio-economic diversity that was always there, looking outward as well as inward (Smylie et al., 2020; Walker et al., 2021; Khalifa et al., 2016; Easton-Brooks et al., 2018; Riley, 2013a,b).

Down in the weeds: more about positive behaviors³

While a focus on assets is central, positive leadership has little to do with being a cheerleader. Rather, it is based on actions that cumulatively reinforce conditions under which all members of the school grow and flourish. Leadership is considered positive because it focuses on building assets rather than ameliorating problems (although all leaders need to do that as well ...).

³This section draws on Louis, K.S., and Murphy, J.F., 2019. El enfoque del liderazgo positivo y su relevancia para las relaciones. In: Weinstein, J., and Muñoz, G., (Eds.), *Liderazgo En Escuelas De Alta Complejidad Sociocultural*. Santiago, Chile: Universidad Diego Portales.

Much of the positive school leadership framework is based on the argument that schools, like other social institutions, function because there is agreement about appropriate relationships, typically formulated as social exchange theory (Emerson, 1976). There is obvious applicability to schools, since principals are expected to know and have some relationship with all the people who work in the school as well as many who are not daily members. The idea of relationships as a form of social exchange thus provided a foundation for understanding the ground on which trust emerges, by creating a “diffuse future obligations” reciprocity based on mutual goals (Sluss et al., 2008) (p. 458). In other words, from an exchange perspective, a leader does not “build trust” directly but engages with others on a routine basis in ways that develop *high quality, trusting* relationships over time.

But the “ah-ha” for leadership practice is the assumption that leaders form *unique relationships with each member of a group* and that *these relationships are reciprocal*. In other words, rather than focusing only on teachers as a group, principals should work with individuals in order to gain insights into how members work with each other and learn to appreciate the knowledge and insights that they gain from the people who work in their building. From an equity perspective, this may also require creating individualized relationships with parents and community members who may have experience exclusion or marginalization in educational settings (Banwo et al., forthcoming; Khalifa, 2018; Theoharis and O’toole, 2011).

By closely examining individual relationships, exchange theory points to the importance of each transaction that occurs in a school. This focus on details and individuals may seem impossible for many school leaders whose days are full with the endless array of job-related tasks (Pollock et al., 2015). However, increasing positive relationships does not always require more time, but the reflective use of the hundreds of interactions that they already undertake every day to solidify relationships and build trust.

Exchange and values

At first glance, a principal operating in a leader–member exchange framework appears instrumental, and possibly even manipulative. However, there are significant value-laden dimensions that are important in all work settings but particularly in schools, where everyone, from bus drivers to superintendents, tends to assume that their work is important because it supports children and youth. This presumption of value-based work allows every interaction to be an opportunity for verbal or non-verbal nurturing of shared values.

This observation is not new, and underpins many texts on school leadership (Sergiovanni, 1992, 1994; Deal and Peterson, 1994; Blumberg and Greenfield, 1986), as well as business (Chen et al., 2015). However, when opportunities are regularly missed, others will notice. In other words, the simple act of reinforcing the value basis of actions between self and other creates bonds that become part of the permanent fabric of a school’s life.

Since many of a principal’s dyadic encounters are visible, often when engaged in routine “management” work in the hall, lunchroom, or outside when greeting or saying goodbye to students and staff, they can be critical to setting expectations for how people work together (Lord et al., 1999). In contrast to a simple leader-centric perspective, the culmination of dyadic relationships helps to shape the way in which all members work with each other to carry out a jointly agreed upon task. In sum, the collective experience of dyadic relationships between formal school leaders and other members forms the basis for a leader’s impact on group climate and cohesiveness (Cogliser and Schriesheim, 2000).

Perceptions affect relationships

Managing other people’s perceptions is tricky business, but there is ample evidence that leaders often misjudge how others see them, and teacher deference to principals means that these are often not articulated (Kolb, 1995; Kolb and Bartunek, 1992; Bird et al., 2009). Yet we also know that leader–member relationships are critical to positive assessment of principal behavior and impacts (Price, 2011), and positive leaders are able to appreciate and understand the emotions of others as well as managing their own responses (Daus and Ashkanasy, 2005; Kotsou et al., 2019). In schools, everyone who is not a formal leader responds to (and influences) the leader–member exchanges discussed above—in fact, they are constantly making those assessments as they interact with their leader, particularly with respect to values and ethics (Mayer et al., 2009). Within a given school, a principal’s actions may be perceived as caring and visionary by some members, but flawed and deficient by others, and these differences in perception cause people to behave differently (Ehrhart, 2004). We illustrate the shifting ground of leader actions versus other’s perceptions in two areas that are considered essential to positive leadership: transparency and fairness. Both illustrate a key point: positive leadership is not a formula, but requires expert decision making in on-the-spot and ambiguous situations (Leithwood and Steinbach, 1995; Shapira and Stefkovich, 2016). Both are also particularly important during periods when there is a significant change or improvement being discussed or implemented.

Transparency

Transparency is a critical aspect of positive leadership that is seen by followers as ethical and moral (Hannah et al., 2005), and trust-inducing (Norman et al., 2010). The media consistently reminds us of the importance of transparency in the public sector, but in school settings, leaders who are more transparent are also more likely to be viewed as authentic (Srivastava and Dhar, 2019; Fox et al., 2015; Shapira-Lishchinsky and Tsemach, 2014; Bird et al., 2013). The idea of transparency can be politicized when conflated with debates about accountability (Koyama and Kania, 2014; Meijer, 2013; Hargreaves, 2015). Moreover, within a school, principals usually believe that they are transparent—but staff differences in their assessments of a school leader’s transparency are inevitable (Bird et al., 2009). Formal efforts to share information may have limited impacts unless it is also reflected in a general

willingness to be vulnerable and open within the group (Vogelgesang et al., 2013). At the same time, however, principal transparency can reduce or ameliorate within-school conflict (Klein, 2012) and can create a “culture of candor” (Bennis et al., 2008), while setting a critical groundwork for trust (Jiang and Luo, 2018).

Although important, principals can only strive to be as transparent as possible and keep testing the desire for more information. Transparency is particularly important during organizational crises or times of significant change, where it has significant impact on member’s assessment of a leader’s effectiveness (Norman et al., 2010), engagement and performance (Vogelgesang et al., 2013). Since a belief in transparency, like trust, takes time to develop, it is therefore an on-going positive leadership task.

Fairness

Fairness, like transparency, is a core element of positive psychology (Duff et al., 2016; Seligman et al., 2005) and key to teachers’ sense that they work in an ethical organization (Bogler and Somech, 2004). Both individual and groups who sense that procedures are fair are likely to put in effort beyond what is required and “they set a positive ethical standard to be followed across the organization” (Hannah et al., 2005) (p. 71). This has practical implications for carrying out key leadership obligations that are often fraught with conflict, such as allocation of scarce resources or personnel evaluations. For example, teachers who view the procedures and criteria used to assess them as fair tend to support teacher evaluation and use it for professional learning; those who see procedures as arbitrary or unfair do not (Vekeman et al., 2015; Tuytens and Devos, 2014). In addition, there are strong associations between teachers’ perceptions of their school as a just environment and their affective commitment to their school (Buluc and Gunes, 2014), as well as their willingness to work outside of their specific responsibilities to benefit the school—an essential aspect of improvement work (Ehrhart, 2004).

Fairness is, however, an area which is fraught for positive school leaders, particularly in the context of school improvement. In particular, there is the hoary issue of recurring incompatibility in different forms of fairness: procedural fairness (everyone treated alike), distributive fairness (those who need more get more) and interactional fairness (people feel equally well treated in specific situations) (Bacha and Walker, 2013). Procedural fairness is expected when it comes to teacher evaluation but, at the same time, it is recognized that there needs to be some differentiation between highly experienced and beginning teachers (Tuytens and Devos, 2019). Strict procedural fairness may be critical under conditions where trust is in question (such as an imposed new teacher evaluation), but less important in a high trust environment (Bacha and Walker, 2013). Procedural fairness needs to be balanced against specific individual needs (Cornelis et al., 2013) as well as school improvement goals, which may require allocating more resources to some teachers or groups than others. Even interactional fairness, which is an antecedent to group commitment and identity (de Lara, 2008), may be abrogated in cases of clear deviant behavior. In other words, perceived leader fairness is an essential component of school improvement—without it, teachers would be unwilling to engage in the additional effort and required collaboration—but is a mercurial aspect of positive leadership.

In addition, leaders almost always believe that they are consistently fair, while others in the organization have a different perception. Monitoring perceptions of fairness and transparency are, thus, particularly important in times of change.

The consequences of relationship-building for school improvement

Every work group is composed of many different types of relationships, but the principal–teacher relationship is particularly important for developing a wider group or organizational ethos. As noted above, as relationships deepen, they become more trusting and transformational, while instrumental exchange relationships have a narrow potential for impact on either party (Walumbwa et al., 2008). Reciprocity between principal and teacher supports the emerging agency and efficacy of both (Tourish, 2014). All evidence suggests that the effects of principals on student experiences and outcome occur primarily as a consequence of developing more engaged teachers (Hallinger and Heck, 1998; Leithwood and Louis, 2011). In other words, principals (and other school leaders) do not control the outcomes of their efforts to establish relationships with others. However, value-based social exchanges between principals and other school members can have multiplier effects when their dyadic relationships multiply, spread and change the organizational climate/culture. We will explore a few of the established outcomes of reciprocity on the potential for school improvement below.

Developing agency

Multiple publications have confirmed the importance of teacher agency, both individual and collective, to the success of school improvement efforts (Riveros et al., 2012; Datnow, 2012; Crandall et al., n.d.; Imants and Van Der Wal, 2020; Hökkä et al., 2017; Priestley et al., 2015). School-based research often identifies empowerment or shared leadership as the means of increasing teacher agency and teacher leadership, as well as improving classroom practices (Bogler and Somech, 2004; Marks and Louis, 1997; Harris, 2013). However, investigations also suggest that principal–teacher relationships provide a critical foundation for more formal initiatives to increase teachers’ contribution outside of their own classrooms. Successful teacher empowerment and shared leadership initiatives are premised on trusting relationships (Moye et al., 2005; Bush and Glover, 2012; Louis et al., 2009). Reciprocity suggests that as teachers’ agency increases, principals’ influence within the school and even in the community also grows. Empowered teachers lead to more influential leaders when relationships are caring and supportive (Printy et al., 2009).

Identification with the school community

To make a commitment to the extra effort of school improvement requires a sense of belonging in and identification with the organization. Isolated teachers may perform well in their classrooms but may make limited contributions to the overall work of the school. The relationship that a member of a group has with their supervisor is particularly important because it has “a significant influence on attitudes toward the organization, among them organizational identification” (Sluss and Ashforth, 2008) (p. 810). A study in China, for example, showed that employees who were engaged in helping relationships with their peers were also more likely to interact with a leader with whom they identified (Carnevale et al., 2019). This investigation is consistent with research in the US which indicates that teachers who see their principals as caring for them individually are more likely to work collaboratively with their peers and to support a socially just distribution of resources in the school (Louis et al., 2016). These findings suggest that if principals have reciprocal relationships with teachers, those teachers are likely to carry the values and ideals of the principal into their work with others.

In other words, collective identity has consequences. Sluss and Ashforth (2008) report that organizational identity—and the relationships that support it—are important because they are associated with how well the group manages tricky issues around diversity and social justice (p. 809) that are particularly critical in today’s schools. The longer-term development of strong interpersonal bonds and group identity increase collaboration and the willingness to take on additional roles (Angelle and Schmid, 2007) which has consequences for grade level/department teams and professional learning communities. It also suggests that principals who are focused on improvement for all students must consider how to create relationships that promote collective identification and authentic relationships with parents and other key actors (Banwo et al., forthcoming; Khalifa, 2018; Theoharis and O’toole, 2011; Riley, 2017).

At the same time, collective identity may constrain improvement initiatives when identity becomes challenged by environmental changes (Kavanagh et al., 2021). In schools, this often arises when there is rapid demographic change in a school’s student population, which may result in teachers collectively clinging to practices that “worked” for them in the past (Hargreaves and Goodson, 2006). Where teachers’ collective identity is not rooted in high quality relationships with their principal, may become oppositional, and undermine school effectiveness (Smylie et al., 2007).

Organizational citizenship behavior

School improvement requires additional initiative from members—typically work that lies outside of the formal expectations associated with the job. Organizational citizenship behavior refers to the “extent to which employees engage in behaviors beyond their prescribed roles” (Ilies et al., 2007) (p. 270). In other words, people do not engage in OCB to enhance personal benefits but because they have a positive sense of identity with the larger organization and its members (Mcneely and Meglino, 1994). The degree to which this kind of pro-social behavior occurs is deeply influenced by leader–member exchanges and perceptions of the ethical climate expectations developed by leaders, a conclusion that is affirmed in studies in the US and other nations (Hackett and Lapiere, 2004; Newman et al., 2017).

There is a wealth of scholarship on organizational citizenship behavior, and its application in educational leadership research is increasing (Dipaola and Hoy, 2013; Nutov and Somech, 2017; Somech and Ron, 2007). Educational leaders in all countries should be concerned with organizational citizenship behavior because it is associated with school climate and student learning (Dipaola and Hoy, 2005; Dipaola and Tschannen-Moran, 2014)—but also with the extra work that comes during innovation and organizational change (Bogler and Somech, 2004).

Job crafting and expert instruction

Educational research pays considerable attention to the idea of organizational learning, or the school-wide capacity to search for and incorporate new ideas (Schechter and Qadach, 2012; Leithwood et al., 1998; Louis, 2008). Even studies of instructional leadership tend to pay limited attention to the details of how principal–teacher relationships affect instructional practice.

But evidence from studies in other work settings suggest that research on job-crafting may provide clues about how principal–teacher relationships affect classrooms. Job crafting refers to the ways in which people “redesign” their work by adding or subtracting activities, or changing other aspects of timing and performance (Berg et al., 2008). In other words, it is grounded in the well-known routines of do-observe-reflect. Job-crafting is the way in which teachers and other professionals become expert in their work (Goller and Billett, 2014). Based on a large study, Marks and Printy (2003) concluded that “[w]hen teachers perceive principals’ instructional leadership behaviors to be appropriate, they grow in commitment, professional involvement, and *willingness to innovate*” (Marks and Printy, 2003) (p. 393. Italics added).

An aspect of individual job crafting that is critical for schools is that it often spills over to teams and professional learning communities (Tims et al., 2013; Schuttinger, 2021), which is where new ideas about teaching and developing students are most likely to be discussed. In other words, schools where teachers are consistently redesigning their classroom work are also likely to be active redesigning and sharing joint improvement efforts, a finding affirmed in multiple countries (Sargent, 2014; McLaughlin and Talbert, 2006; Stoll et al., 2006).

Quality matters in leader–member exchanges

Much of leadership theory (and the “wisdom” of consultants) depends on relatively simply but uniform rules. In real life, however, good principals are not rule-bound but adaptive (Heifetz, 1994). Authentic leaders take into account both individual preferences and the particular contexts of leader–member exchanges (Sternberg and Vroom, 2002; Louis et al., 2016). Exchange theory’s focus on dyads thus presumes that relationships are situational and personal. *Quid pro quo* relationships are usually low-quality and indicate a tenuous mutual commitment, while social exchange relationships tend to be “more open-ended, long-term, and less in need of an immediate ‘payoff’” (Walumbwa et al., 2011) (p. 734). There is no consensus on the full range of underlying socially valuable consequences of “high quality” leader–member exchange relationships. Often noted outcomes include: affect, loyalty, contribution, and professional respect (Ilies et al., 2006) along with mutual affection, contribution to mutual goals, and professional respect (Liden and Maslyn, 1998). But there should be no mistake: Achieving adaptive, authentic, high quality relationships on a daily basis in any school is a challenging task.

In education, the consequences of lack of individual sensitivity are serious: teachers who leave a school report that dissatisfaction with their principal is a major reason (Grissom, 2011; Boyd et al., 2011). However, not all teachers in a school will have the same reaction to a principal: any individual may have devoted followers as well as those who are more ambivalent or detached. This variability makes the work of establishing positive relationships particularly complex. Consider the implications of the statement that “leaders form different types of exchange with respective followers” (Liden et al., 2008) (p. 163).

Time and timing matter

The development of solid relationships varies not only by individual, but also over time. A new principal coming into a school where a beloved former principal has retired has one job; the new principal entering a school that was led by an incompetent or abusive leader has a different task. Both, however, must start at the beginning. Even established leaders confront inevitable turnover. One may have excellent social exchange relationships with an existing group, but a principal must bring each fresh recruit (who enters with their own set of experiences with good or bad leadership) into a unique leader–member exchange. Of course, it helps if the staff tells the new teacher that “our principal is great”, but socialization, by definition, develops through experience rather than new employee orientation or school handbooks. Wang et al. (2005) affirm a developmental approach, with three developmental stages (stranger, acquaintance, partner) that become successively more transformational (p. 423). In other words, shifting the basis of a relationship from professional obligation to collaboration is a process whose timing will vary depending on the people involved.

Four practical conclusions are of particular importance to school leaders.

- (1) *Principals should recognize differences in experience and skills.* For example, a first-year teacher requires a different kind of role-making signals than an experienced teacher–leader.
- (2) *Earlier stages in establishing a relationship, where the leader attempts to discover the relevant talents, motivations, and limits of the member, are critical.* Later stages, where there are clear mutual understandings within an established relationship, require less time (Nahrgang et al., 2009). Of course, this will have a big impact on how a principal spends his or her time depending on the frequency of staff and principal turnover in a school.
- (3) *Member views of their relationship with a leader tend to become more aligned over time:* a principal who can establish good relationships with a core group of teachers is likely (unless they represent a coalition in a conflict-filled school) may extend this to teachers who may be more reluctant to interact frequently with their formal supervisors.
- (4) Unlike many leadership narratives, individualized relationships between leaders and others must also attend to reciprocity, including how member characteristics and reactions affect leader perceptions of the members (Nahrgang et al., 2009). One specific example is that principals who see their teachers (collectively) as professionally competent are likely to have stronger individual social bonds with their teachers (Louis and Murphy, 2017).

Exchanges are always in context

We must remember that a focus on the development of relationships is not abstract theory, but the result of how real people react to real exchange settings. *At the micro level, every exchange involves an action and a reaction.* A leader acts (the principal calls a meeting); followers read and interpret those actions within the immediate context (“her meetings are usually short and useful” vs. “another wasted 45 min”). These actions and reactions have a further impact on followers in related contexts and the cycle is re-engaged as leaders respond to followers engaged or disengaged responses. In other words, the potentially transformational relationship is strengthened or eroded based on smaller transactional events. In the end, there is an organizational response based on a myriad of individual experiences in school relationships.

So how can principals help to make others see their actions as “high quality”, responsive, and adaptive? Research suggests that they must keep one eye on their daily interactions, keeping in mind the obvious generalities—reaching out whenever possible and offering care along with respect, opportunity, and trust (Walumbwa et al., 2009; Smylie et al., 2016, 2019b).

Paying attention to what supports relationships

The focus on individual relationship building will be of little use if school leaders do not attend to what supports the work of others in the school. They can also ask about what is getting in the way of teachers', counselors' or food staff's best work and adjust norms, teams, and work schedules to make sure that unnecessary barriers are removed—part of ongoing task of redesigning the organization (Walumbwa et al., 2011; Geijsel et al., 2003; Leithwood and Jantzi, 2005). In other words, a principal who wonders why the school's two-year old professional learning communities initiative has yielded very little might ask whether teachers were reluctant to tell her that 45 minutes of common meeting time was insufficient to move beyond procedural work, as well as revealing previously unacknowledged conflicts among staff (Voulalas and Sharpe, 2005). Finally, research suggests that leaders also need to pay attention to indirect supports for other members of the school, working on structures that can be almost invisible until they fail (Sluss et al., 2008). In other words, relationship building provides the base for and becomes intertwined with information gathering/asset building those principals need to due to create a high-functioning, high performing school.

The importance of peers

Schools are comprised of many individual members who also have relationships with each other. It has long been acknowledged that peer groups dominate the day-to-day life of any work group (Blau, 1955) which can have both positive and negative effects on leader–member relationships (Seashore, 1954; Podsakoff et al., 1997). As noted above, cohesive teacher groups who are strongly identified with the school can be supportive of collective goals—or may play an oppositional role. However, in general, it is well established that strong ties among teachers will have a positive effect on their satisfaction and improvement efforts (Daly et al., 2010; Louis et al., 1996; Banerjee et al., 2017). In addition, groups that have stronger ties among the members are more likely to exhibit positive behaviors that support both the organization and individuals (Cogliser and Schriesheim, 2000).

Informal teacher leaders emerge (Anderson, 2004) and effective principals often acknowledge their importance by supporting them in ways that enhance overall group effectiveness, cohesiveness, energy and effectiveness. Leithwood et al. (2007) refer to this as “taking the ego out of the system” (Leithwood et al., 2007) (p. 37). This does not reduce the importance of leader–member exchanges but acknowledges that effective principals (and formally appointed teacher leaders) need to understand not only the individual members who work in their setting, but also the informal organization. This is particularly important during any school-wide improvement initiative, where informal leaders often play a significant role (Sun et al., 2013), as well as their impact on job-crafting and individual improvement (Gordon et al., 2020).

Organizational outcomes of leader–member exchanges

There is a clear developmental cycle in a principal's relationship with others in the school that leads from individual interactions to climate/culture to commitment to the school. Research suggests that when leaders demonstrate both their *expertise* and their grounding in the *positive leadership values*, the following important organizational outcomes are likely (Murphy and Louis, 2018):

- Leader–member exchanges lead to valued *reciprocal outcomes*
- Which leads to *member satisfaction with the leader*, and *Commitment to their shared vision and rewards*,
- Which reinforces and deepens an *emotional connection* with and *trust* in the leader, leading to
- *Task performance, student learning, and more individual and collective effort extended to innovation and improvement.*

Remembering reciprocity

Critically important is the development of wide-spread reciprocity—a fundamental antecedent of the informal “psychological contract” that encourages both teacher and leader engagement in creating an organization based in positive functioning (Coyle-Shapiro, 2002; Bakker and Schaufeli, 2008). The research community often ignores the chicken-and-egg quality of the leader–member relationship, which tends to see leader behavior as a cause of other member's behavior, but solid teacher–principal relationships are based on a teacher's willingness to provide positive input to the relationship. Responsive teachers who work well with their principals encourage the principal's repeated investment in relationships. This, of course, will reinforce future value-centered and asset-based behavior on the part of the leader.

The positive impact of teachers on principal's effectiveness is under researched, but scholarship in other work settings provides evidence that “the interpersonal relation of supervisors to subordinates affects subordinates' identification and self-concepts, which in turn, are critical determinants of social and organizational processes” (Lord et al., 1999) (p. 170). In schools, teachers' extra efforts (organizational citizenship behavior) may induce the principal to increase his or her perception of the teacher's professionalism and provide additional “rewards” that give that teacher additional learning opportunities (Liden et al., 2008). Translated across many teachers, this outcome of individual leader–member exchanges may lead to increased capacity for organizational learning (Louis and Murphy, 2017), “job crafting” and investment in improvements. It is also connected to the tendency of employees to grant their leaders more latitude in acting, or a bank of “idiosyncratic credits” that allow leaders to make an occasional mistake without sacrificing all of the goodwill that has been built (Hannah et al., 2005). All of these latter points attend to the need for more research on teacher reciprocation.

Can any school leader do this?

Busy principals may shudder at the idea of adding enhanced leader-member exchange to their already full plate, but we argue that it requires only more attentiveness to the small acts that fill their day and can often be implicitly or explicitly tied to improvement objectives. Colleagues, students and others in the school are already watching, and each exchange will be filtered through the individual's lenses which, according to many of the authors we have cited, will attend to their *authenticity, meaningfulness, challenge, and relevance*. Only when those are in play will teachers reciprocate with honest feedback, which is essential to uncovering assets and locating barriers that need to be removed (Drazin and Joyce, 1979; Schein, 1999).

To be effective, the specific behaviors, words, and actions that elicit a positive response in others will vary between contexts and cultures. Much of the research that underpins this article has been carried out in the United States, but there is no evidence that we can find from studies conducted in other countries that the principles and concepts underlying positive school leadership cannot be translated to other cultures. However, we know that people's perceptions of leaders and how they prefer to relate to them vary greatly between countries (Hofstede, 2001). This is, of course, why "off the shelf" recommendations for how to reform schools often require a great deal of adjustment when they move from one country, culture or context to another. But principals, whether introverts or extraverts, must recognize that they need to get out of their offices, initiate exchanges, and do so in manner that reinforces assets. More important than personal characteristics are a strategic behavioral commitment to make every exchange, no matter how brief, count.

We conclude by returning to the distracting dichotomy between "management" and "leadership" that has permeated the leadership literature for decades, leading to the erroneous conclusion that leadership consists primarily of planning and executive action. Based on our experience working with school leaders and the positive organizational research, we argue that:

- (1) The capacity of school leaders to be influential rests on the way in which others in the organization perceive them.
- (2) The perceptions of others will be fundamentally based on accumulated observations and personal relationships that induce trust, respect, identification and ownership.
- (3) School leaders will find that the easiest way to induce these positive responses is through attention to interpersonal exchanges during routine management activities that bring them into contact with others.
- (4) Positive exchanges do not have to reinforce the status quo but can provide incentives for continuous school improvement.

This does not imply that leadership work stops with the development of good exchanges, but without a solid ground, the best improvement initiatives will be unsuccessful.

Introduction

Leadership is one of the most studied topics in the educational literature. Scholars in educational administration have long deconstructed and reconstructed leadership from different perspectives. Some have studied the roles, functions, traits, or styles of educational leaders (Day et al., 2016; Gardner, 2000), while others endeavored to identify the qualities of successful leaders (Deal & Peterson, 2000; Leithwood and Riehl, 2003; Murphy et al., 2017) and still others examined transactional and transformational types of leadership (Bass, 1997; Burns, 1978; Leithwood and Jantzi, 2000) just to name a few. As we look across all of the work one of the foundational threads that cuts across the varied leadership conceptualizations is that leadership implicates the role of self and other in a complex set of social interactions. However, while those sets of relationships are implicated they are often not front and center in the study of leadership (Daly, 2010; Donaldson, 2006; Leithwood, 2019). A more relational perspective on leadership foregrounds the role of social interactions and is interested in the social space between individuals and the outcomes of interactions (Liou et al., 2015). This perspective on leadership is not a new nor revolutionary one, but given new advances in both theory and methods, it is worth carefully revisiting and that is the goal of this paper.

Dating back to the 70s, scholars begun to acknowledge that the execution of leadership is not confined to those in formal administrative positions, but rather, is something that flows throughout an organization with individuals within organizations being able to exert leadership (Barnard, 1968; Thompson, 1967). As we fast forward a number of decades, the more relational perspective took root with the concepts such as distributed leadership (Spillane, 2006), networked leadership (Liou and Daly, 2019b; Díaz-Gibson et al., 2017), professional learning (Penuel et al., 2012), and networked improvement communities (Russell et al., 2017). These scholars and others view leadership as a phenomenon that can be located within the relations between and among others within organizations or systems. Leadership in this space is more of a variable that can be measured through relations at different levels of organizational systems, e.g., individual, group, organization, or systems, and related to a number of outcomes.

An increasingly growing body of research in education has begun to explore the social aspect of systems using social network theory and analysis specifically to the work of leadership in educational systems (e.g., Liou and Daly, 2014, 2019a, 2020b; Coburn et al., 2013; Daly and Finnigan, 2011, 2016; Moolenaar and Slegers, 2015; Penuel et al., 2012; Spillane and Kim, 2012), and more recently leaders' online interactional behaviors (Daly et al., 2019a,b). These lines of research view leadership as a part of a larger

social system and how it is manifest in “networks” as a key feature to systems and ultimately systemic change. Viewed through a network perspective, leadership is focused on the pattern of relationships that is likely to influence or be influenced by the beliefs and behaviors of others with whom leaders have a social tie.

Building on the social paradigm of leadership, we argue that it is important to understand leadership as being explicitly grounded in the role of interaction and interdependence and as such can be conceptualized and assessed by new advances in social network theory and methods. In making this argument, we offer a network perspective on educational leadership through introducing social network theory and analysis and its relationship to leadership and change. We discuss key insights from network literature and organize a framework that describes a social network approach to educational leadership. Finally, we conclude with several promising directions for future research in this space.

Moving toward networked systems leadership

The social paradigm of leadership shifts our attention from the individual to the sets of relationships that surround leaders. This view recognizes the social role of leadership and is interested in those in formal positions with leadership titles (formal leaders) as well as those that play important informal leadership roles as determined by their set of social ties (informal leaders) (Balkundi and Kilduff, 2006; Gardner, 2000; Leithwood, 2017; Spillane, 2017). Both formal and informal leaders are important to supporting cohesion. Scholars examining educational systems and reform have suggested that better linkages among individuals and segments of a system may result in improved communication, shared understanding, and ultimately greater coherence throughout the system (Agullard and Goughnour, 2006; Honig and Ikemoto, 2008). As these relationships are interdependent in nature and consequential to systemic and coherent change, we adopt a systems perspective to the social aspect of leadership (Liou et al., 2015; Díaz-Gibson et al., 2017; Leithwood, 2017; Leithwood et al., 2020; Pitts and Spillane, 2009; Sun et al., 2013). The balance of the systems work suggests that leadership exists at various levels in both formal hierarchical relationships and informal influence pattern within collaborative systems of organizations (Kramer et al., 2019). Scholars have noted that shifting from individual to the relational, and attending to formal and informal positions, may hold potential in better understanding the social infrastructure of systems change (Daly et al., 2017; Goldspink, 2007). Following these developments in leadership research, we view leaders in educational systems as those individuals, participants or actors that emerge in networks of social connectivity exerting (or attempting to, or having a potential to exert) influences on system-wide practice toward a purpose.

This more systems approach to leadership is driven by systems thinking (Senge, 2006)—a system of thinking about systems (Arnold and Wade, 2015)—that suggests that any change in one component part of the system may result in intended or unintended behaviors/consequences for other parts of the system (Senge, 2006). Systems thinking also focuses on the ways in which a system’s constituent parts interrelate within and respond to the context of its larger systems and as such leaders that emerge from within the systems must be taking a more systems perspective on how discreet parts take shapes a unified whole (Shaked and Schechter, 2019). Recent scholarship advocates for the use of systems thinking in educational leadership, as described by Shaked and Schechter (2019), “Systems thinking was claimed to help educational leaders to see public relations as a continual, systematic process that is essential for engaging the school community’s support to improve students’ learning” (p. 577). This view of leadership underscores the role of “relationship” in shaping systems practice toward a common purpose, and thus resonates with Donaldson’s (2006) view on educational leadership: “leadership is a relationship that mobilizes people to fulfill the purposes of education” (p. 47). Similarly, this relational emphasis of leadership corresponds to the “distributed” perspective that posits that “leadership is stretched over the work of multiple leaders” (Spillane and Diamond, 2007, p. 8) through the interactions of leaders and followers (Pitts and Spillane, 2009).

The work around “participative” systems perspective as a foundation provides some analytic purchase to further consider the relational role of leadership. Participative systems mainly refer to the cooperation or collaboration among systems of organizations as an appropriate solution to address issues related to organizational changes (Connelly, 2007; Kramer et al., 2019). Leadership in this literature focuses on the capacity for creating conditions that foster collaboration or cooperation among and between cross-sector organizations (Connelly, 2007; McCaffrey et al., 1995). Absence of relational linkages between parts of a system may limit the possibility of leading a success change (Daly and Finnigan, 2016).

Therefore, the systems approach to leadership and improvement requires a shift in the way that change strategies are formalized and enacted within a system. This shift corresponds with the social paradigm of leadership and suggests a move from a singular focus on parts of a system to engaging the entire segment of the system formed by networks of connections. Scholars taking the systems approach to organizational change indicate a wide range of strategies for building stronger intra- or inter-organizational ties (Honig, 2008; Popp et al., 2013; Tsai, 2000). These strategies include building structures to foster collaborations between levels in organizations (Daly and Finnigan, 2016), enhancing communication and knowledge sharing by bridging ties within and across organizational levels (Liou and Daly, 2020a; Honig, 2006, 2008), distributing leadership (Spillane, 2006), and creating “network initiation team” to foster commitment and motivate others, rather than using formal power to impose roles or mandate actions (Russell et al., 2017). All of these strategies suggest the importance role of social interdependencies in supporting change efforts.

These perspectives on leadership set leadership parameters at various levels of systems, e.g., individuals, relational dyads, subgroups of a system, and the whole systems. They situate leadership in a systems context and suggest that the nature of leadership is relational, distributed, participative, and networked, all of which considers networks as a feature to systems performance. As such,

leadership is embedded within networks of systems and shaped by social processes. These perspectives reinforce the important tenets of existing leadership literature and further introduce a network perspective on leadership that deserves greater attention. Taken together, we argue that leadership is a systems quality that is embedded within networks of social systems and shaped by social processes.

Social processes in the shaping of leadership

Social processes involve the complex interplay between interdependencies of individuals and their relational ecosystem toward common goals as well as their beliefs which governs their decision making and behaviors (Liou and Daly, 2020b; Siciliano et al., 2017). Discussion of social processes derives from social learning theory that posits that human behavior is constructed and shaped through direct experience and interactions with others and their surroundings (Bandura, 1977, 2002). According to Bandura (1971), "Behavior partly creates the environment and the resultant environment, in turn, influences the behavior. In this two-way causal process the environment is just as influenceable as the behavior it controls" (p. 40). In this view, social competencies can be developed, shaped through interactions that are embedded within social context and are key quality to enable learning (Bandura, 2006; Baron and Markman, 2003).

This view of human social processes helps explain the social nature of leadership. Leadership, based on the above-mentioned perspectives, is conceptualized as a process of influence toward an outcome. Specifically, such leadership largely involves social influence that occurs in sets of relationships where individuals are both influencing and influenced by one another, which affects the patterns of interactions embedded within the systems (Donaldson, 2006; Ogawa and Bossert, 2000). Central to this view of leadership in its social processes is interactions and conditions that foster such interactions (Liou and Daly, 2020b; Lin, 2009). In education, recent developments in leadership research emphasize the value of social processes and relational linkages involved in leading and change (Liou et al., 2015; Daly, 2010; Pitts and Spillane, 2009). This line of research treats leadership as based on the deployment of resources that reside in social relationships, and examine social relationships through networks. It is argued that networks of relationships may provide leaders with the necessary resources and social infrastructure to exert social influence in achieving individual and organizational goals such as implementing reforms or improving student outcomes (Liou et al., 2015; Spillane and Kim, 2012). Leadership from a network perspective emphasizes individual agency and the interdependence of social behavior that are reflected by a network of relational linkages that may moderate, influence, or inform the flow, speed, type, and level of engagement of social activities and mobilization of resources such as knowledge, information, skills and practice (Daly, 2012).

While a growing number of studies explore the social aspect of educational leaders using social network analysis (Coldren & Spillane, 2007; Daly & Finnigan, 2016; Liou, 2016; Liou & Daly, 2014, 2018, 2019a, 2020a; Pitts and Spillane, 2009; Spillane and Kim, 2012), this space still has room to grow around the study of educational leadership. In the following section, we draw on social network theory and analysis and research literature to understand the social aspect of leadership and its potential influence on change.

Social network theory and analysis

Networks

The term "networks" has been widely used in leadership and management research as a promising organizational structure for addressing problems that require the access, use, and mobilization of resources across organizational systems to engage actors in collective action toward a common purpose (Liou and Daly, 2020a; Hoberecht et al., 2011; Russell et al., 2017). A network is formed by a constellation of three or more individuals (nodes, actors, or organizations) that are connected based on types of relationships for a particular purpose (Liou and Daly, 2020a). In other words, networks consist of structures of relationships between actors that exist for common purpose(s) (Popp et al., 2013). From a systems perspective, networks can be used as a way of thinking about and configuring organizational systems (Borgatti et al., 2018).

Social networks: theory and analysis

Social network analysis is theorized based on two analytically distinct domains: network theory and theory of networks (Borgatti and Halgin, 2011). Network theory, according to Borgatti and Halgin (2011), refers to "the mechanisms and processes that interact with network structures to yield certain outcomes for individuals and groups" (p. 1). In this regard, the theory is concerned with the resulting consequences of network structures, such as being highly connected or centrally positioned (Borgatti and Ofem, 2010). Examining relational structures and their consequences becomes central to most of the network studies in this paradigm (Borgatti and Halgin, 2011). For instance, much of the network research has focused on characterizing network structures (e.g., cohesion) and actor positions (e.g., centrality), and associated these network features with actor- or group-level attributes or outcomes (e.g., Daly et al., 2020; Spillane and Kim, 2012). A theory of networks is used to explain the processes that determine a given network structure (Borgatti and Ofem, 2010). Studies of this theoretical paradigm use analysis that models formation of ties and structural effects to best characterize the network structure (e.g., Liou and Daly, 2019a).

Despite the different orientations in theorizing social networks, what remain similar are the core assumptions underpinning the study of networks. First, network research focuses on the study of sets of actors and relations/ties that connect them (Kilduff and Brass, 2010). Second, actors are embedded within a network and as such are assumed to be interdependent and interconnected rather than independent (Degenne and Forsé, 1999; Wasserman and Faust, 1994). Third, relationships between actors are regarded as “ties” (linkages or connections) that provide for the exchange of resources (Burt, 1982, 1997; Kilduff and Brass, 2010; Lin, 2009). Fourth, network structure formed by relational ties has influence on the flow of resources to and from an individual as well as across a system (Borgatti and Foster, 2003; Lin, 2009). Fifth, network structures can act as both opportunities and constraints for individual and collective action (Kilduff and Brass, 2010). These core ideas are important in grounding our discussion about leadership and its research.

Social networks: relationship to leadership and change

As discussed earlier, one of the key purposes of educational leadership is to shape organizational systems for individual and/or collective outcomes and the key medium of such leadership practice is social interaction. The practice of shaping systems involves leading and sustaining changes at scale and ensuring learning occurs within the systems (Kezar, 2018). Changing at scale (or scale-up) involves the adoption/use of practices, strategies, or reform initiatives by a broader reach of individuals over time (Coburn, 2003). In achieving scale-up, networks are found to be one of the most effective strategies, as networks help to identify opportunities and constraints for the spread of practices necessary for change (Daly and Finnigan, 2016; Kezar, 2011; Russell et al., 2017).

Studies in education and leadership have identified several ways that link networks with change (Daly, 2010; Daly and Finnigan, 2016; Russell et al., 2017): opportunities to learn, development of social capital, innovation, and collaborative capacity (Liou and Daly, 2020a). First, network research suggests that social networks provide existing and potential opportunities that enable relationships for learning—through accessibility to resources (Lin, 2009; Liou and Daly, 2018; Liou and Canrinus, 2020), diffusion, exchange, and transfer of knowledge and information (Hubers et al., 2018; Spillane and Kim, 2012), peer influence (Liou and Daly, 2019b; Supovitz et al. 2010), and shaping of norms, beliefs and attitudes (Liou and Daly, 2020b). Second, networks facilitate the shaping of social capital by providing accessibility to resources that are embedded within relationships which can be mobilized to increase the likelihood of success in purposive action of change (Daly and Finnigan, 2016; Lin, 2009). Third, as change often involves execution of innovation that entails risk-taking, network members may create a climate that is trusting, open and risk tolerant so that they can learn from others’ innovative solutions and are willing to sustain their participation in collective action (Hoberecht et al., 2011). Finally, in achieving a long-term and systemic change, networks need to develop their collaborative capacity for change (Provan and Lemaire, 2012; Weber and Khademian, 2008), which resonates with the concept of networked improvement communities (Russell et al., 2017).

Taken together, network approach to leadership and change involves several social undertakings. To begin, network members need to develop a sense of commitment to the common purpose of the network. These network members mutually engage, share useful practices, use leadership to influence connectivity, strategize collaboration, and create a mechanism that monitors performance and accountability by assessing networks’ capacity for reaching a range of network members whose participation in the network is essential for achieving the common purpose (Russell et al., 2017; Weber and Khademian, 2008). Network members, be they individuals or organizations, can exert their networked leadership influence across the systems in creating a web of resources and support, which can benefit the networks to meet specific goals and scale practices.

Key insights from social network research related to leadership and change

As relationships between actors are central and pivotal to leadership and change efforts, network studies take into account the web of relationships in which actors are embedded that both support and constrain opportunities for individual influence and overall outcomes of the network systems (Borgatti and Ofem, 2010). Those relational ties are connected between sets of actors to form paths (trials or walks required from one actor to another) that can be regarded as pipes through which resources (information, ideas, knowledge) can flow. These paths form an overall network structure in which each actor possesses a particular position and sets of actors shape up a particular subgroup. Network positions determine in part individual actors’ (dis)advantages points and network patterns of the paths influence resource flow and thus may impact network performance. As network patterning and its consequences can be understood at different levels of network systems, we follow Borgatti and colleagues’ (2010, 2018) typology of network research to organize key insights from network research in education by three levels of analysis: the dyad, the node, and the group and whole network. We include the most often used network concepts related to leadership and change in the educational literature.

Dyad level: homophily and relational ties

The dyad level mainly is concerned with pairs of actors. Studies in this space focus on (1) why two actors are connected through a particular relation or (2) the extent to which such dyadic connections influence similarity of beliefs, attitudes, or perceptions between actors. The first type is often referred to as (de)selection model and associated with the network phenomenon—homophily, which is the tendency for people to form ties with those similar to them (Lazarsfeld and Merton, 1954). Network studies have

examined homophily effect of individuals by demographic (age, gender, race/ethnicity), social status, beliefs, or geographical locations (McPherson et al., 2001). In education, studies have found that teachers tend to engage in extensive professional dialogue with colleagues who teach at the same grade and are a close friend (Frank and Zhao, 2005; Penuel et al., 2010). Teachers who attend professional development events in a similar subject area are more likely to form help-seeking ties with others in the same area (Spillane et al., 2012). Research in educational leadership that examines tie formation among a group of leadership team suggests that leaders tended to form ties with others who are physically close at work (within district or within school site) (Daly et al., 2016; Liou, 2016) and shared similar efficacy beliefs about their leadership skills (Daly et al., 2016). Other research that examines both the formation and dissolution of ties among a middle school's teachers and administrators suggests that educators who serve as a teacher leader, teach the same subject, and share different years of experiences are likely to establish and maintain new ties (Liou and Bjorklund Jr., 2021), and changing grade levels or losing leadership position predicts the dissolution of ties among elementary school staff (Spillane and Shirrell, 2017).

The homophily effect as an explanatory variable for the formation of ties contributes to the understanding of the work of leadership in terms of how leaders may consider shaping similarities in beliefs, work level, and other attributes to facilitate connections between peers. Tie formation as a result of actor homophily can speed up the flow of information necessary for change but might also result in sharing redundant information thus impeding change. In contrast, establishing ties that are heterophilous (Granovetter, 1973)—diverse in types of ties and span of sources for information and knowledge—can facilitate change by accessing new and diverse information/ideas but might slow down change processes because it takes more time for resources to travel across multiple, less tightly connected actors. Educational reform and change efforts are better advanced by developing social infrastructure that facilitates the formation of heterophilous ties among leaders and stakeholders for obtaining diverse views, resources and input (Daly & Finnigan, 2010).

The second type of network studies—*influence*—focuses on the role of dyads in explaining change in actor behaviors, beliefs, or attitudes. The idea of influence captures the processes of social influence by which an actor's beliefs/views or behaviors assimilate toward those held by members of their network (Siciliano and Thompson, 2018). Studies in educational leadership that seek to explore the influence effect are limited with only a few studies examining teacher practice. For instance, scholars have found that a teacher's own beliefs about reform initiatives tend to assimilate the level of beliefs held by those peers that this teacher is directly connected (Siciliano et al., 2017). Others have suggested that teachers' instructional practices are influenced by the behaviors of those peers with whom they are frequently interacted (Frank et al., 2013).

Typology of ties

As most of the research in education at the dyad level has to do with formation of relational ties, it is important to briefly discuss the type of ties analyzed in these studies and its function. Network researchers distinguish between two types of relational ties by their functions: instrumental ties and expressive ties (e.g., Ibarra, 1995; Lincoln and Miller, 1979). Instrumental ties tend to be work-related involving the gathering of information and resources for a particular professional purpose (Labianca and Brass, 2006). Expressive ties typically involve expression of interpersonal affect and are more normative and affect based (Umpfress et al., 2003). Expressive ties are consequential for the formation of stronger ties that can enhance team performance (Henttonen et al., 2013), whereas instrumental ties are typically information-driven and helpful for disseminating information and ideas (Labianca and Brass, 2006).

Both types of ties can be leveraged for change. For instance, educational scholars found that expressive ties such as close relationships tend to have a greater influence on teacher attitudes toward reform than instrumental ties (Cole and Weinbaum, 2010), and that teachers being identified as close friends to their peers is positively associated with the degree of accessibility to expertise inside and outside their school they perceived (Penuel et al., 2009). Shifts in educators' beliefs about mathematics instruction are associated with changes in their instrumental ties around seeking advice and information about the instruction (Spillane et al., 2018). In addition, as both types of ties often co-exist and interact in work settings, another line of research in educational leadership explores this understudied area based on positive organizational psychology literature that suggests that social support and emotional health of leaders are critical to their leadership performance (Balkundi and Kilduff, 2006). Research in this space suggests that leaders who are considered as energizers—individuals who make others feel positively inspired and motivated—are more satisfied with their job (Daly et al., 2016) and more confident about their leadership and management abilities (Liou and Daly, 2019a).

Strength of ties

Another way to understand complex relational ties is to assess the degree of tie strength. Strong ties are typically characterized by frequent interaction, prior/existing connections, intimacy (close knit), multi-layer relations (multiplexity), or mutual confiding (reciprocity) (Granovetter, 1973) and sometimes correlate with the concept of bonding social capital (Putnam, 2000). Weak links, where bridging social capital can be found, are characterized by infrequent, distance, loose relationships that are oftentimes non-reciprocated and less close (Granovetter, 1973). Strong ties are found to facilitate complex change as they are more likely to promote two-way exchanges of tacit, non-routine, and detailed knowledge and information, whereas weak ties are best suited to communicating direct, non-routine information that requires little time and efforts and are more helpful to quickly spread ideas and information, thus fostering diffusion of innovation (Tsai, 2000). While strong ties tend to be more stable and coherent due to their mutual dependency used to maintain a strong linkage (Monge and Contractor, 2003), these linkages may lead to network closure thus constraining the creation and exploration of new information necessary for innovation (Burt, 2007). Weak links typically do

not offer substantive social support or intimate connections, which also implies that individuals are not bounded by social norms, thus more open to new ideas.

In education, Coburn and Russell (2008) study a mathematic curriculum reform of elementary school teachers and measure their tie strength by combining frequent interaction and close relationship. They found that teachers' strong ties help to reshape their pedagogical approaches (Coburn and Russell, 2008). Another study by Daly and Finnigan (2011) examines tie formation in understanding change efforts among central office and site leaders in an underperforming school district. They investigated over-time changes in four types of ties (existing, reciprocal, asymmetric, and absent) and found increases in weak linkages over time but slightly drops or no change in strong ties. A more recent study by Liou and Daly (2019a) examines a strong tie of educational leaders that has occurred over a span of three years and involves work-related influence and energy relations. They found that the sustaining of these strong ties is associated with shared beliefs about leadership and geographic work location. Understanding tie strength may help leaders to assess the type and degree of social capital, which can be used as levers for innovation and change (Hoppe and Reinelt, 2010).

Node level: centrality

The node level network analysis primarily considers individual actors' network position and neighborhood. Most studies exploring this area treat an actor's network position as outcomes or as predictors. Network position, from a social network perspective, is different from the formal, contractual position discussed in most of the leadership and management literature. It refers to the social, informal position of individuals emerged in a social system which has greater influence than those with positional authority on how resources/information flows to that individual and ultimately how those resources get used in a system (Balkundi et al., 2011; Daly, 2010; Penuel et al., 2009, 2012; Spillane et al., 2012). The network position of an actor is determined by the constellation of ties that actor has, including both incoming and outgoing ties (Scott, 2017). Although there are a number of structural measures to determine an actor's network position, we focus our discussion on key centrality measures that are mostly found in educational studies: degree centrality and betweenness. We then discuss the direction of causality these measures are used in some of the educational studies.

Degree centrality

Degree centrality often refers to the number/proportion of ties a node has in a given network. In an undirected network (ties are symmetric, e.g., have a meeting with), degree centrality is the number/proportion of ties a node has regardless of directionality of ties. In a directed network (e.g., advice seeking) where ties are directional, the number/proportion of ties a node sends or receives can be calculated separately, which produces node-level outdegree or indegree centralities. The outdegree of a node indicates the node's activity, whereas a node's indegree refers to their popularity (Wasserman and Faust, 1994). In network research, degree centrality is often equated with informal leadership: individuals with higher degree centralities (more centrally located like "hubs") tend to have greater social power and influence over the network (Brass, 1992). In some studies, it is used to measure the volume of social capital a node has (Coburn and Russell, 2008; Daly et al., 2014; Liou and Daly, 2018; Penuel et al., 2009).

Another similar concept to degree centrality is the measure of closeness centrality that takes into account not only number/proportion of ties but also distance from a node to all others (Brandes et al., 2016). A node with a high closeness score means there is a short distance between them and most others, and as such they can quickly reach others to access and share relational resources in an efficient manner (Borgatti et al., 1998). Given they are highly and well connected as being points of multiple intersecting relations, these central actors tend to occupy a hub position and therefore have a greater opportunity (more social capital), and a better vantage point, to access, be exposed to, and leverage, the flow of relational resources (Kilduff and Krackhardt, 2008; Scott, 2017). However, they are also more likely to be constrained by the norms and beliefs held by their tightly connected networks, which may lead to social conformity (Krackhardt, 1999) or stagnation (Krackhardt and Kilduff, 1990).

The role of central actors as outcomes or predictors can be found in educational literature. For instance, Moolenaar et al.'s (2010) study of school principals' network position as measured by indegree centrality indicates that the indegree mediates the relationship between reported levels of transformational leadership and innovative school climate. Another study by Daly and colleagues (2014) examines network positions of both central office and site leaders as functions of seeking or providing advice around reform efforts in three districts using indegree and outdegree centralities. They found that leaders who occupy more central network positions (i.e., higher out- or in-degree) reported as being more confident in their ability to exercise leadership. Their findings also indicate that leaders' formal position (e.g., central office or school site) does not significantly contribute to explaining their informal social position, which suggests the importance of informal social positions in a districtwide reform network. As for closeness centrality, research on networks of school principal and teachers indicates a positive relationship between closeness and relational trust for teachers and principal (Liou and Daly, 2014). This work suggests closeness serves as an important proxy measure for interpersonal trust. A more recent study by Liou and Daly (2020b) uses indegree centrality to investigate the role of educational leaders' network position in shaping leader beliefs about reform. Their work indicates that indegree (i.e., being sought for advice and providing work recognition) mediates the relationship between leaders' engagement in reform efforts and their beliefs about the reform. These studies suggest the importance of "informal" social position in a network, particularly being central, as consequential to the social side of leadership.

Peripheral or isolate

Contrary to actors with high degree centrality, actors with low or zero degree centrality—often referred to as peripheral or isolates—also receive much attention in the network literature in education. Peripheral or isolated individuals represent a leadership challenge, such as disconnections between subgroups that are structured for a certain work division, or too many structural holes (Burt, 2005) in a team or organizational system that prohibit interaction, communication, or collaboration, and ultimately collective performance (Daly, 2012; Daly and Finnigan, 2010; Liou and Daly, 2018; Oh et al., 2004). These challenges also reflect opportunities for leaders to find ways to make these individuals more central if necessary in order to facilitate systemic change (Kilduff and Krackhardt, 2008). For instance, Daly and Finnigan's (2010) study on knowledge and communication networks among a district-wide leadership team indicates that the majority of school site principals tend to occupy peripheral or isolated positions compared with their central office administrative colleagues, which poses challenges to achieve changes at scale.

Betweenness

Another type of centrality that has received much attention to the study of leadership and change is betweenness centrality that measures the degree to which individuals occupy an intermediary position (brokering) between dyads of actors that are otherwise disconnected (Kilduff and Tsai, 2003). Betweenness helps identify those actors that bridge or broker and who help connect different clusters, groups or actors, and thereby play a key role in coordinating activities and information flow across a system (Balkundi and Kilduff, 2006; Hoppe and Reinelt, 2010). Few studies in educational leadership explore the broker role of educational leaders. For instance, Daly and colleagues (2014) examine brokerage patterns among superintendents in a large urban school district. They found a lack of brokering activities from area superintendents in bridging the central office and school sites. This lack of brokerage by leaders in the formal hierarchical system (area superintendents) led to a host of "informal" brokers moving resources and weakening overall district coherence around reform. Other studies that investigate betweenness of educational leaders, although reported a non-significant role of leader betweenness as a predictor (Moolenaar and Slegers, 2015) or an outcome (Wang et al., 2016), suggest the importance of betweenness as a key centrality position that cannot be overlooked in understanding the social influence of leadership.

Group and whole network level

The group and whole network level considers the overall network properties as well as subgroup structures that are embedded within the larger network. Network studies in this area focus on (1) explaining characteristics of whole network or group network structures or (2) using these network structures to predict other outcome variable(s). We discuss several network measures that are commonly used in network research in education to describe network structures: density, centralization, fragmentation, E-I index, and core-periphery. The density, centralization, and fragmentation are often used to assess cohesion of a network, while the E-I index and core-periphery analysis are mostly used to examine degree of closure for subgroup structures. The density of a network is the ratio of the observed ties to all possible ties. The centralization of a network refers to the degree to which the network is concentrated in one or a few focal nodes (Wasserman and Faust, 1994). A highly centralized network is characterized by a large variation in actor degree centralities in which a few nodes have large numbers of ties while most nodes have very few. In contrast, a less centralized network is one in which all nodes have similar degrees of connections. Focal nodes in a highly centralized network have disproportionate influence over resource flow, whereas nodes in a decentralized network share similar opportunities to access and exchange information/ideas and thus can help move resources faster from and to the periphery (Sasidharan et al., 2012).

Network fragmentation indicates the percentage of the number of disconnected dyads divided by all possible number of dyads in a network. The E-I index (external-internal index) measures the degree of closure at the whole network, subgroup, and individual levels. It takes the number of ties that are external to the groups minus the number of ties internal to the groups, and divided by the total number of ties (Krackhardt and Stern, 1988; Wasserman and Faust, 1994). The E-I index ranges from 1 (all ties are external) to -1 (all ties are internal), with 0 indicating a balance between external and internal interactions (Krackhardt and Stern, 1988). A core-periphery analysis seeks to identify two groups of actors in a network based on the degree of cohesion within each set of actors. A core-periphery network structure is defined as one that has a dense cohesive core of actors with the rest of actors loosely connected to one another as a periphery group (Everett and Borgatti, 1999).

Understanding these network/subgroup structures can help identify strengths and weaknesses in communication, information flow, and the shaping of group beliefs/norms necessary for change (Gibson and Vermeulen, 2003). In particular, subgroups (affiliated by interest, affection, or task) are often identified as important structures to the development of new ideas and problem-solving that move change forward, as they often share higher levels of trust (Finnigan and Daly, 2010). They can be capitalized to facilitate systemic changes by leveraging or connecting them (Daly, 2010; Daly et al., 2014; Liou and Daly, 2018).

A few studies in educational leadership have examined the overall network structures of educational leaders. For instance, Daly and Finnigan (2010) study the communication and knowledge network structures of central office and site leaders and suggest that the overall network tended to be sparsely connected (density) and highly centralized around a few central office leaders (centralization), with site principals tending to be on the periphery of the network. The E-I index result in their study suggested that leaders tended to interact more often with those sharing similar work level (district to district and site to site). They also demonstrated how such work level divide resulted in a core-periphery structure that prevented cross-level communication, information sharing, and ultimately systemic change. In a later work, Daly and Finnigan (2012) found a high degree of network fragmentation

among a districtwide leadership team from an underperforming school district, suggesting a lack of exchanges of leadership practices across the district.

Recent studies on educational leadership also explore these network-/group-level structures among a district's high school principals (Liou and Daly, 2018) or a cluster of schools within a community of learning (CoL) network (Sinnema et al., 2020). In Liou and Daly's study (2018), they found a lack of reform-related collaborations over time for the high school principals to connect with one another or with other levels' administrative colleagues, and an absence of these high school principals being in the core structure of the reform network. Sinnema et al.'s (2020) study focuses on the role of formal leaders (CoL leaders) and informal leaders (teachers) in a CoL network of collaborative relationships. Their findings indicate a sparse collaboration network and that only a quarter of the CoL leaders are in the core structure of this collaboration network with the majority of the core members being teachers, suggesting the emerging role of teachers in taking on leadership responsibilities that facilitate cross-school reform. Taken together, understanding the overall network structures illustrated by different metrics can help identify areas that may be better leveraged to support systems or systemic changes and improvement (Daly, 2012; Daly and Finnigan, 2016).

Framing networked systems leadership for change

Building on the abovementioned insights from existing network research in education, we provide a framework in Fig. 1 that depicts the social processes of leadership from a networked systems perspective. Leadership, in our view, is embedded not in particular individuals or roles, but in the relationships that exist among actors working toward outcomes in a networked system. This view shifts our attention to the social processes of leadership and suggests that individuals can draw on relational resources to influence or be influenced by others in order to enact their roles toward desired outcomes. Leadership thus lies in the systems of relations within which individuals are embedded. Individuals can exert leadership at different levels of the systems by their social influence affecting how their systems routines are structured and normalized, which in turn can shape the role, beliefs, and network behaviors of individuals.

Given the continuous social processes of leadership at various levels of social systems, systemic changes can be thought of as being shaped in two dimensional spaces: time and level of network. Over time, changes take shape as individuals engage in ongoing cyclic processes of social influence and (re)structuring of various levels of social systems in which they are nested. In other words, changes at the individual level will likely affect tie formation at higher-order levels (e.g., dyadic and subgroups), and in turn the overall structure of the whole network, and any changes at the network/subgroup level (e.g., internal/external policy or organizational restructuring) may also shape the attitudes, beliefs, norms, positional or social roles, and network behaviors of individuals, which continues to affect the process of network structuring at the higher levels of the systems. During the structuring process, individuals' characteristics may influence how their ties and beliefs are formed, and their beliefs, attitudes, and social positions can be further shaped by reconfiguring their social ties through networked practices (e.g., interventions to promote, constrain, or strategize connectivity). In other words, leadership is organizing dynamic social processes that is contingent upon relational resources one can draw on to enact their roles at different levels of social systems.

Fig. 1 Networked systems leadership for change.

Promising developments of networked systems leadership and change

As leadership is understood through complex social processes from a network perspective, social network analysis is a promising approach for the field. Although the use of social network analysis in leadership research has gained traction over the past decades, there remain areas of developments for future work, which we outline below.

Longitudinal dynamic networks

As leadership is shaped by relationships which can also shape individuals' social behaviors, a consideration of full dynamic models that account for both the selection model (individuals' social behaviors as function of their attributes or beliefs) and influence model (individuals' attributes or beliefs as function of their social behaviors) is desired. Network research often find correlations between peer influence and individuals' behaviors/views in which an actor's behaviors/views are shaped by the views/behaviors of their connected peers (social influence effect). It is also possible that it is the attributes of individuals (gender, beliefs, etc.) that affect the decision of their social selection. Such dynamic models can better represent complex social processes that are both outcomes and predictors influencing each other. A full dynamic model also requires the analysis of longitudinal data at two or more time points in order to yield stable results. Modeling these network dynamics can better understand how and why networks evolve over time, which enables educational researchers to further examine the underlying mechanisms involved in the shaping of social systems as related to leadership. Much of the existing research in educational leadership foregrounds either the selection or influence model with only a few studies employing these models (e.g., [Daly and Finnigan, 2011](#); [Siciliano et al., 2017](#)), future work may consider the use of full dynamic network models to investigate the social dynamics of leadership ([Frank et al., 2010](#)).

Two- or multi-mode networks and multilevel networks

The vast majority of network studies in education deals with one-mode (one-dimension) network in which the rows and columns in an adjacency matrix of network index one set of entities (e.g., actor by actor or event by event matrix). As social processes of leadership involve the engagement of relationships not only with people but a lot of times in meetings and/or professional development activities, information gathered based on one-mode network activities may only provide a partial view of leadership. Two-mode networks allow the field to examine relationships between sets of entities such as actors, subgroups, committees, affiliations, etc. A two-mode adjacency matrix includes the rows and columns each representing one set of entities (e.g., person by event, person by association) ([Everett and Borgatti, 2013](#)). One can imagine a two-mode network that illustrates relationships between educators and their activities, such as attending multiple professional activities or serving on more than one committee. These activities or events serve as conduits through which individuals/groups may influence one other ([Everett and Borgatti, 2013](#)). For instance, educators who attend multiple meetings have greater opportunity to share information or resources with their peers who only attend one meeting. Better understanding how information/resource flow from one meeting to another, strategies to leverage meetings with greater participation, and key informal leaders or brokers between meetings are crucial to enhance overall coherence in regard to change effort. Extending the two-mode network, one can even imagine analyzing multi-mode networks of educators, such as reform initiative, issues or concerns related to reform efforts, areas of expertise, and so forth.

While the two- or multi-mode networks address the width of activities involved in leadership, multi-level networks are concerned with the embedded nature of relationships for leadership. The studies discussed in prior section span multiple levels of the system, including: individual and dyads of teacher/administrator networks within schools or a larger district system, clusters of schools (principals or community leaders) within a district or community system, and the social or organizational system under study as a whole. These studies demonstrate that leadership and change exist at different levels of systems that are sometimes interacting with one another. As such, it is important to take into consideration data collected from multiple levels through a network perspective. As network data collects information about relationships and activities involved in leadership and is often nested (relationships in individuals in groups in systems), results from multilevel models provide a more nuanced and integrated understanding of phenomena that unfold across levels in systems.

Real time, multi-data sources in profiling networked leadership phenomena

Leadership occurs through interactions that are complex, nested, and multi-faceted in terms of data sources. We discuss a new trend in social network analysis in education that better captures the dimension (depth and width) and dynamics of social processes. The dimension of social processes involves where and how relationships take place and the nature of the relationships. It includes the collection of data from multiple sources in explaining the shaping of relationships, the content of such interactions, as well as the space where the relationships take place, e.g., online social media or physical in-person space (offline). The dynamics aspect refers to not only the social selection and influence effects as discussed earlier but also the movement among actors across different periods of time (e.g., network churn). Taken together it is the space, time, and data sources that provide a more holistic picture of leadership through a network lens.

The majority of existing research that examines the dynamic models primarily focuses on the face-to-face (offline) social activities of educators, as opposed to those that occur virtually (online) through social media (e.g., Twitter, etc.). A growing body of

scholarship calls for a full examination of educators' social activities connecting their offline and online social behaviors to best represent the social continuum (Daly et al., 2019a,b) or social dynamics of such phenomenon (Karimi et al., 2019; Pescosolido, 1992). This line of research examines educators' real time relational network data through their social media footprints to capture phenomena such as social diffusion of opinion leaders who are disseminating information and potentially influencing others' perceptions about topics (e.g., education policy) (Daly et al., 2019b), virtual communities of learning or professional groups (Liu et al., 2020). Other studies have come to integrate data sources from both spaces to examine classroom practice (Hu et al., 2020), administrators' sources of expertise and support (Daly et al., 2019a,b). Apart from the online and offline data sources, motivated by several mixed methods studies in social network analysis (e.g., Coburn and Russell, 2008; Daly and Finnigan, 2011; Froehlich et al., 2020; Judy Kamalodeen and Jameson-Charles, 2016; Liou and Daly, 2014), attending to the nature of interactions may yield more fruitful results than merely examining the presence or absence of a relational tie. Instruments that include questions concerning the depth of interactions (the when, what, why, and how of the interaction) may provide better insights into the social work of educators. This new approach to social processes is promising in disentangling complex behaviors and practices as related to networks and leadership in both online and offline spaces.

Conclusion

As the work of systemic change is ultimately enacted in systems by networks of individuals, theories and research attending to systems and social networks offer a promising lens for understanding social phenomena of change and leadership. In this article, we offer several contributions that connect social networks with leadership and change: (1) conceptualizing leader and leadership, (2) positioning leadership as a relational quality of systems, (3) linking social network concepts to leadership and change, (4) summarizing a framework supported by scholarship in education that takes a social network approach to educational leadership at different levels of systems, and (5) providing areas of developments in social network analysis in education that may offer different but complementary sources for understanding the social processes of leadership and change. Emerging themes in social network analysis supporting leadership development and systems change are important, yet underdeveloped, and as such represent high leverage theoretic and analytic points for future research in educational leadership.

Over the past several decades, research on school leadership has developed a theoretically informed empirical knowledge demonstrating that school leadership contributes to student learning through strategic actions that focus on changing a constellation of sociocultural, structural, and academic processes (e.g., Bryk et al., 2010; Day et al., 2009; Hallinger and Heck, 2010; Leithwood et al., 2004, 2020; Robinson et al., 2008). Despite a well-documented substantive knowledge base describing how school leadership facilitates school improvement, scholars have highlighted two related shortcomings. First, relatively more attention has been directed at the substance of the findings than the appropriateness and quality of the methods utilized to support the knowledge claims (Goff and Finch, 2016). Stronger methods underpinning substantive results can reduce rival explanations. Previous scholars documented that such studies are in relatively short supply in the field of school leadership and improvement (Feldhoff et al., 2014; Hallinger and Heck, 2011; Thoonen et al., 2012).

Second, other than identifying potential associations between leadership and mediating variables, there is still a need to link studies of leadership and its relative distribution within the school more closely to school changes in learning practice, which can bring us closer to addressing the question of how different contextual and school conditions and patterns of school leadership interactions and strategies contribute to growth in student learning outcomes (Harris, 2008). Over the past decade, recognition that leadership can result from broad leadership sources within the school affects how school leadership is conceptualized in longitudinal studies focusing on improvement—that is, as an organizational quality of schools versus a collection of personal characteristics of the individual in the role (Ogawa and Bossert, 1995). Although scholars defined meaningful distinctions between terms such as distributed (Gronn, 2002; Spillane, 2006), shared (Marks and Printy, 2003; Pounder et al., 1995), and collaborative leadership (Bolden, 2011; Hallinger, 2013), all three terms reflect a similar concern for broadening the sources of school leadership. As Leithwood et al. (2020) recently concluded, the function of leadership at all levels, or distributed leadership, is to build the organizational conditions that foster high quality teaching and generate improvements in learner outcomes. School improvement, by definition, entails a change in the state of the organization over some period of time (Luyten et al., 2005). Yet, Leithwood et al.'s review showed that there is less understanding of how school leaders enact changes within the school in ways that facilitate improvement in educational processes that result in improved student learning. This implies the need to study school leadership and its potential to bring about changes in such organizational conditions over longer periods of time, as it takes considerable time for improvement in outcomes to unfold (Heck and Chang, 2017; Louis and Miles, 1991).

Research methods provide an important, but often unacknowledged, link to the development of a valid knowledge base underlying the practice of school leadership (Feldhoff et al., 2014; Goff and Finch, 2016; Heck and Hallinger, 1999). In one recent review of methods underlying school leadership and student learning research, Goff and Finch (2016) noted the need for stronger research designs underlying knowledge claims in the field (i.e., as most previous research was cross-sectional or case study) and greater attention directed to the temporal ordering of variables that can bring about improvement through the use of longitudinal designs and data collection. Because school improvement involves changes in the state of the school's processes, it requires designs and data that can take into account changing relationships among relevant variables (Feldhoff et al., 2014). Unfortunately, it can be challenging to obtain sufficient data that attend to both the hierarchical (and cross-classified) nature of schools as organizations through having available subject identifiers and the necessary temporal ordering of educational process variables and student achievement data over sufficient periods of time.

Given the relevance of school improvement as a policy goal in an era of global educational accountability and, in particular, school leadership, in facilitating academic improvement over time, the purpose of this chapter is to develop the rationale for the increased use longitudinal designs and data collection in future school leadership research. To begin, I provide a context for the use of longitudinal data in examining school improvement. I then comment on two longitudinal studies using varied research

designs and longitudinal data that have extended our understanding of a problem previously investigated primarily with cross-sectional data. Finally, I outline a couple of promising types of longitudinal designs that are likely to contribute to knowledge regarding the intersection between school leadership and school improvement over the next decade.

Some background

Since the mid-1960s, numerous scholars documented the substantive progress in developing the knowledge base regarding school leadership and its effects on school processes and student outcomes (e.g., Bossert et al., 1982; Boyan, 1988; Bridges, 1982; Edmonds, 1979; Erickson, 1967; Hallinger and Heck, 1996a, 1998; Harris, 2008; Hendriks and Scheerens, 2013; Leithwood, 1994; Leithwood and Duke, 1999; Leithwood and Montgomery, 1982; Leithwood et al., 2008, 2020; Marks and Printy, 2003; Ribbins and Gunter, 2002; Robinson et al., 2008; Willower and Forsyth, 1999; Witziers et al., 2003). Such reviews are useful in identifying trends in knowledge development, understanding emerging issues in the realm of practice, and critiquing research methods used in generating knowledge.

In addition to identifying studies that document pathways through which school leadership may influence community, school, and classroom processes that can enhance student learning (e.g., Bossert et al., 1982; Bridges, 1982; Hallinger and Heck, 1996a; Hendriks and Scheerens, 2013; Kruger et al., 2007; Leithwood et al., 2004, 2010, 2017, 2020; Robinson et al., 2008), a second tangible result of reviews examining scholarly progress has been a broader view of the sources of school leadership than simply the school principal (e.g., Gronn, 2002; Harris, 2008; Leithwood et al., 2020; Ogawa and Bossert, 1995; Spillane, 2006). Historically, research on school leadership focused predominantly on the principal's role, given the inclination to assume leadership was an individual quality exercised by those in formal leadership roles (Heck and Hallinger, 1999).

A third result is the recognition that school improvement, and leadership's role in facilitating it, is more of a "journey" than a specific event, and contrasting leadership configurations and strategies which may be emphasized, are in part, determined by the challenges schools may face in relation to where they are located in their particular improvement journeys (e.g., Bryk et al., 2010; Day et al., 2009; Hallinger and Heck, 2011; Heck and Reid, 2020; Jackson, 2000). At any point in time, the school's efforts to improve may be shaped by multiple factors, including its intake of students, the quality and engagement of its faculty and administrators in improvement, as well as its academic and social organization (e.g., Bossert et al., 1982; Hallinger and Heck, 2011; Heck and Reid, 2020; Leithwood et al., 2020). This implies the need to study school leadership and its potential to bring about changes in normative structures, educational environments, academic processes, and student learning outcomes over longer periods of time than commonly thought—perhaps four to seven years, or longer—rather than two to three years (Bryk et al., 2010; Heck and Chang, 2017; Louis and Miles, 1991).

Although the field of school leadership and school improvement has generated much scholarly interest over the past 50 years, most reviews of scholarly progress concluded that such reviews focused primarily on the status of substantive findings rather than methods of inquiry (e.g., Goff and Finch, 2016). There have, however, been a number of methodological reviews over the previous 50 years that attempted to integrate the substance of research findings with theoretical models and methods underpinning the individual studies in an attempt to evaluate or enhance methodological progress in developing a school leadership knowledge base (e.g., Bridges, 1982; Erickson, 1967; Everhart, 1988; Goff and Finch, 2016; Hallinger and Heck, 1996b; Halpin, 1957; Heck and Hallinger, 1999, 2005; Murphy, 1988; Pitner, 1988; Tatsuoka and Silver, 1988). Although identifying some promising approaches, the reviews suggested scholars mostly struggled to identify the field's key problems, conceptual frameworks, methods of inquiry, and a knowledge base that can directly inform improvement practices in schools.

Early reviewers concluded that the tradition of research on the impact of principals did not generally do justice to the complexity of the topic in terms of theoretical and methodological sophistication or application to school settings (Bossert et al., 1982; Bridges, 1982; Erickson, 1967). For example, in reviewing methodological progress from the mid-1960s to 1980, Bridges concluded progress was dismal, noting "Despite the rather loose definition of theory that was used in classifying the sample of research ..., most of it proved to be atheoretical. Likewise, the research seemed to have little or no practical utility" (pp. 24–25). In reviewing progress 15 years later, Phil Hallinger and I concluded that although school leadership research had contributed to substantive progress in understanding how leadership affects school outcomes through several mediating processes, several methodological shortcomings remained (Hallinger and Heck, 1996a,b). Our primary concerns were the utilization of simplified theoretical models to examine complex sets of dynamic relationships, overall reliance on a small set of analytic tools, and limitations of cross-sectional data in testing proposed theoretical relationships, including the effects of environmental and organizational conditions that moderate the school's capacity for improving student learning. Later, in revisiting methodological progress, we noted continued quantitative progress in studying selected domains of school leadership, as well as the acceptance of varied qualitative methods in examining a broader range of issues in researching school leadership (Heck and Hallinger, 1999, 2005). We concluded these latter approaches of situating school leadership research within multiple contexts was advantageous in addressing blind spots in our knowledge and disciplinary practice, for example, focusing on the moral and ethical ends of leadership in addition to its effects (Anderson, 2004; Dillard, 1995; Gronn, 2002; Gronn and Ribbins, 1996; Spillane et al., 2001).

More recently, Feldhoff et al. (2014) and Goff and Finch's (2016) reviews of methodological progress in studying school leadership and learning emphasized the need for greater attention to the conceptual frameworks, research designs, and analytic techniques that underlie the robustness of the findings of previous studies. Feldhoff et al. argued that school improvement studies need to take into account both the multilevel structure of schools and the need for longitudinal measurement of school improvement effects.

Because of the multilevel nature of educational organizations, the recognition of its hierarchical levels (e.g., students, classrooms, schools, districts) is key to advancing and properly testing propositions regarding macro (contextual) and micro (individual behavior) linkages in examining school, classroom, and student achievement processes. Such macro-level factors moderate relationships at lower levels—leadership to teacher professional practices and teacher practices to students (e.g., Heck and Hallinger, 2014; Slegers et al., 2014). Goff and Finch also concluded that previous analytic methods used to examine school leadership were generally inadequate to deal with the realities associated with leadership and school improvement.

Scholars reviewing the various contributions of previous research on school leadership, consistently highlighted three specific problems. First, many commonly accepted findings were generalized from cross-sectional studies, rather than larger-scale longitudinal studies that could better account for the temporal ordering of theoretical relationships. One primary criticism was that the research seldom gave adequate attention to the careful delineation of research methods including the measurement of key constructs and the temporal ordering of those constructs in order to link leadership to student learning and to build a sound knowledge base in school improvement research (Creemers and Kyriakides, 2008; Hallinger and Heck, 1996a; Luyten et al., 2005; Reynolds et al., 2000; Sammons and Luyten, 2009; Witziers et al., 2003). Because cross-sectional data are unable to resolve the ambiguity in correlations or other measures of association, it is more difficult to rule out alternative explanations regarding proposed relationships.

The over-reliance on cross-sectional designs hampered understanding how school leaders enact strategies and programs that affect school improvement over time (Hallinger and Heck, 2011; Harris, 2008; Scheerens, 2012). More specifically, the *snap shot* nature of cross-sectional research is useful in identifying factors that may differentiate higher producing versus lower producing schools, but it cannot inform regarding the nature of the process that leads to one set of outcomes over the other (Goff and Finch, 2016; Luyten et al., 2005). Because organizational change is a dynamic process with interdependent factors that change through time, improvement implies a change in organizational conditions (e.g., resources, capacity, attitudes, behaviors, outcomes) and, therefore, is most appropriately studied from a longitudinal perspective (Feldhoff et al., 2014).

Causal claims depend on a temporal sequence with identified causal mechanisms that are hypothesized to account for expected outcomes (Cook and Campbell, 1979; Goff and Finch, 2016). Conceptual frameworks help contribute to the accumulation of knowledge by providing a basis for comparing the results of a current study with previous studies within a logical and consistent framework. Although there are multiple research designs to get at causal inference (e.g., clinical trials, time series data with introduced treatment, regression discontinuity) one popular approach uses longitudinal panel data made up of multiple units measured at multiple occasions (Zyphur et al., 2019). It may (or may not) include an intervention at some occasion during the temporal sequence. Such data are useful for causal inference by helping to control for potential confounds. As Feldhoff et al. (2014) argued, the assignment of such attributions is facilitated by reliable theoretical justification and the measurement of independent and dependent variables at different points in time (Gustafsson, 2010; Hallinger and Heck, 2011; Marsh and Craven, 2006; Zyphur et al., 2019). Hallinger and Heck concluded that causal ordering represents an important theoretical issue with practical implications in studies of leadership related to student learning.

In the absence of experimental designs, which do not readily lend themselves to studying school improvement, such studies are largely natural experiments to improve student learning, conducted in widely different external conditions (e.g., policy environments) and with associated strengths or weaknesses in essential mediating supports (e.g., Bryk et al., 2010; Day et al., 2009; Hallinger and Heck, 2010). They require laying out expected results and building a case regarding *what* changed and *how* based on multiple types of time-related data. Importantly, innovations in both data collection and analytic approaches can lead to further insights often missed in more simplified previous studies of “associations” between variables. For example, as Bryk et al. noted in their longitudinal study of school improvement, utilizing repeated survey data on school conditions, rather than data collected at only one occasion, provided more time-sensitive measures of changes in the essential supports in explaining subsequent changes in school achievement and, therefore, greater confidence about the conclusions.

Second, early studies framed principals as the causal agents for organizational change (e.g., Edmonds, 1979). More recent studies provided increasing evidence that school leadership is an organizational quality, or unit of analysis, rather than an individual quality (Ogawa and Bossert, 1995; Spillane et al., 2001) and, as such, may be relatively more (or less) distributed throughout the school (Gold et al., 2002; Gronn, 2002; Harris, 2008; Spillane, 2006). This newer conceptualization impacted how leadership was conceptualized in longitudinal studies; that is, as a quality of schools versus a quality of the individual in the role. Initial studies identified the positive impact of leadership that was more distributed—decentralized in terms of responsibility, participation, and engagement and collaborative and interdependent in terms of involvement and monitoring of implementation—which impacted student achievement indirectly through school-wide strategic efforts aimed at improving school organizational conditions that support teaching and student learning (e.g., Camburn et al., 2003; Heck and Hallinger, 2009; Leithwood et al., 2020; Spillane et al., 2011). For example, Spillane and colleagues found leadership was distributed most successfully when it was seen to represent a form of collective responsibility, intelligence and sense making, with leadership for school improvement emerging as an interactive process of influence designed to achieve organizational ends. Leithwood et al. noted the function of leadership at all levels, or distributed leadership, is to build the organizational conditions that foster high quality teaching and generate improvements in learner outcomes, the success of which depends on opportunities for discretionary decision making by those enacting leadership.

Third, often previous research was criticized as falling short in terms of producing knowledge that can be utilized directly to improve student outcomes, given the nature of school improvement processes operating under different conditions. A simple example was studies that still reported that principals directly affect student outcomes. There is no practical meaning or application that can be attached to that finding, because there is no presumed process connecting the observed association between the effect

(i.e., be it principal experience, education, or quality) and the outcome. This challenge is to produce *usable* knowledge, which is tied to the need to understand more thoroughly how academic improvement actually unfolds over time at multiple levels within school districts (i.e., in schools, in classrooms, and among student peer and instructional groups). Of course, all research efforts to guide real-world action must acknowledge gaps between evidence, action, and its consequences (Deaton and Cartwright, 2016).

Features of longitudinal data

Edmonds (1979), in his early work on instructionally effective schools, was among the first to recommend longitudinal data in documenting school effectiveness. He noted future "... studies of school effectiveness should be multivariate in character and employ longitudinal records of pupil achievement in a variety of areas of school learning" (p. 22). Edmonds also recommended identifying school determinants of student learning in smaller-scale studies that described the nature of their school environments and associated academic processes, in contrast to the large-scale studies of the 1960s (e.g., Coleman et al., 1966) that used cross-sectional data and statistical controls to document the low academic outcomes of urban poor students ascribed to their family backgrounds. Edmonds documented several initial studies which identified strong principal leadership in setting the tone of the school, helping to decide on instructional strategies, and organizing schools resources, and the attitudes and behavior of teachers as differentiating improving versus declining schools (e.g., Brookover and Lezotte, 1977; Weber, 1971). Although the calls appeared in the literature, the challenges were great, both in obtaining longitudinal data on students and teaching processes, as well as having the technical means to deal with problems such as missing data that were prevalent in longitudinal data. Of course, during the next decade, the documented evidence of school effects (e.g., targeted professional development, teacher quality and engagement, district and principal support) on student learning began to accumulate such that the public, policymakers, educators, and researchers concluded that schools do make a difference (e.g., Berman and McLaughlin, 1977; Firestone and Corbett, 1988; Rutter et al., 1979; Scheerens and Creemers, 1989).

Despite the recognition that cross-sectional data were not well suited to investigations of processes that are assumed to be dynamic, the development of proper methods to examine change challenged researchers for many years. Time is a key factor in understanding how organizational processes unfold, as well as how their impacts may be observed. Temporal issues and the observation of changes are central to research on school leadership and improvement in school and classroom processes that lead to increased student learning. Strategies for school improvement develop, are implemented, and produce impacts which may not become apparent until a considerable amount of time has passed. A key consideration, therefore, in the design of longitudinal studies is how time will be incorporated and measured. Although time figures into the design of the study, change is often the object of the researcher's interest—change in student learning, school values and beliefs, academic processes, teacher and administrator behavior, and so forth. Newer approaches for examining longitudinal data offer greater flexibility in testing hypotheses concerning more complex relationships in the data where independent, mediating, and dependent variables may be changing over time, where changes in individuals and groups are examined simultaneously, and where separate growth trends can be compared before and after an intervention is introduced.

Although studies on school improvement routinely include longitudinal data on students, less attention has been given to monitoring changes in organizational processes at the school and classroom levels. As Griffin (1997) recognized, examining leadership effects also requires the need for longitudinal data that can describe changes in organizational processes over time. This data, however, can be difficult to obtain in ways that permit the examination of leadership effects across comparable organizational units (Hallinger and Heck, 2011). As Day et al. (2016) concluded, sustaining successful improvement effects results from schools' work in utilizing context-sensitive strategies that progressively shape and layer the school's work, culture, and achievement. We therefore must conceptualize school improvement as embedded within an organizational system that is changing over time and connect changes in the leadership and school organizational conditions to subsequent student academic growth in reading and math. Given that leadership is viewed as an adaptive process (e.g., Hallinger and Heck, 2011; Ogawa and Bossert, 1995), it is likely that these types of processes are mutually reinforcing in successful school improvement. Mutual influence implies that two (or more) variables, for example, leadership and school organization, may be both a cause and an effect of each other over time; that is, earlier temporal states of the component variables will mutually reinforce each other over a subsequent interval (time lag) or intervals (Hallinger and Heck, 2011; Heck and Reid, 2020).

Until recently, researchers did not have access to analytic tools capable of modeling more complex relationships involving successive measurements that may be mutually-reinforcing, changing at different organizational levels simultaneously, and that may affect the multiple environments (e.g., schools, classrooms) in which learning takes place. As Hallinger and Heck (2011) noted, aside from the need to study change through the measurement of component processes over time, the investigation of causal processes is also a function of selected research designs, where stronger designs (experiments and quasi-experiments) that manipulate treatments are better able to eliminate rival explanations of results and yield more defensible conclusions. School settings, however, are not readily amenable to experimental designs. Therefore, quasi-experimental research designs capable of examining temporal relationships over a number of occasions (i.e., at least two) may be useful where a particular type of intervention or strategic improvement action may be monitored before and after implementation, and possible changes in key school, classroom processes, and student outcomes observed (Goff and Finch, 2016; Heck and Chang, 2017). Degree of association between proposed variables, relative isolation from other extraneous variables, existence of a temporal relationship (which establishes the direction of influence), and replication of results enhance claims of causal relationships (Bollen, 1989; Campbell and Stanley, 1966).

Longitudinal designs in school leadership research

Building on calls for a more substantial knowledge base, during the past 15 years collective international research began to conceptualize school improvement as a process that unfolds over a number of years. These studies made use of longitudinal designs examining the impact of school leadership on strategic actions to improve academic and social processes within schools with an aim at improving student learning (e.g., Day et al., 2009; Hallinger and Heck, 2011; Heck, 2009; Heck and Chang, 2017; Heck and Hallinger, 2014; Leithwood and Louis, 2012; Mulford and Silins, 2003, 2011; Opdenakker and Van Damme, 2007; Thoonen et al., 2012). This work was facilitated by a trend whereby governmental bodies in various parts of the world began to develop substantial longitudinal datasets on school processes and outcomes (Hallinger and Heck, 2011). It also provided empirical support for the facilitative role that leadership plays in creating and sustaining a school-wide focus on learning for students, teachers and staff (Fullan, 2001; Leithwood et al., 2010; Robinson et al., 2008). Moreover, the empirical work also highlighted a capacity-building perspective especially supported by studies of transformational school leadership (Leithwood and Jantzi, 2000; Mulford and Silins, 2003).

Recent research found successful school improvement efforts targeted coordinating instructional practices with student needs and whole-school reform strategies where teachers felt the changes would benefit children, where they had raised expectations for student work and their own professional performance, and where there was increased instructional standardization, but teachers could make personal adaptations (Datnow and Castellano, 2000; Louis and Miles, 1991; Mintrop and Trijillo, 2007; Rowan and Miller, 2007). School leadership facilitated the selection, implementation, and evaluation of strategic actions that led to building the school's instructional capacity (e.g., teacher instructional skills, teaching strategies, quality of instructional experiences) and its relationship to increased student learning (Coelli and Green, 2012; Day et al., 2009; Feldhoff et al., 2014; Leithwood et al., 2004; Mulford and Silins, 2003, 2011; Murphy and Meyers, 2008; Robinson et al., 2008; Thoonen et al., 2012). This suggests viewing leadership actions as more collaborative, flexible, and contingent on schools' specific improvement needs. As scholars concluded, therefore, leadership not only impacted school actions to improve school conditions supporting academic and social organization, but it was also shaped by the context in which it was exercised (Bossert et al., 1982; Day et al., 2009; Jackson, 2000; Luyten et al., 2005; Mulford and Silins, 2011; Southworth, 2002). Moreover, external conditions such as increased accountability could result in re-defining values and routines, leadership responsibilities, interactions among individuals, and corresponding strategic actions (Stacey, 2001).

Longitudinal designs also open up the possibility of examining changing school processes (e.g., leadership, school conditions) as mutually reinforcing, which provides an alternative means of unpacking the issue of causal ordering in leadership and school improvement research, given that leadership is viewed an adaptive process (e.g., Hallinger and Heck, 2011; Ogawa and Bossert, 1995). Such processes imply that leadership and school organization, may be both a cause and an effect of each other over time (Hallinger and Heck, 2011; Heck and Reid, 2020; Marsh and Craven, 2006); that is, earlier temporal states of the component variables can mutually reinforce each other over a subsequent interval (or time "lag") or intervals. This approach has the advantage of facilitating a test of the hypothesis that initial school leadership influences subsequent school organization over time, as well as simultaneously responds to initial conditions in those organizational processes.

Two example longitudinal studies

In recent decades, longitudinal research designs have become the preferred approach for investigating individual and organizational development over time, and corresponding analytic approaches such as latent curve modeling and multilevel growth modeling have quickly become methods of choice for such research designs. In this section, I briefly discuss features and findings of two longitudinal studies among a set that examined leadership and school improvement over time (e.g., Bryk et al., 2010; Day et al., 2009; Hallinger and Heck, 2011; Heck and Hallinger, 2009; Mulford and Silins, 2003; Mulford and Silins, 2011; Opdenakker and Van Damme, 2007). Exemplars include the longitudinal examination of leadership, school practices, and school and community conditions leading to school improvement in reading and math over a seven-year period (Bryk et al., 2010) and the utilization of mixed methods in describing leadership's influence on improving school conditions in ways that lead to growth in academic outcomes over three years (Day et al., 2009).

Day et al. (2009) study

In one of the largest longitudinal studies examining improvement across some 360 elementary and secondary schools (Day et al., 2009), the research design focused on studying a subset of *improving* schools identified from an analysis of national data on primary and secondary school performance. The researchers utilized absolute student improvement and value-added contextualized improvement data to identify schools that significantly raised pupil attainment levels over a three-year period. Approximately a third of primary and secondary schools met the criteria for selection. From this set of improving schools, researchers identified three groups which made sustained improvements but from different starting points (i.e., low, moderate, and high) and contextual characteristics. Primary data collection included initial questionnaires sent to school heads and key staff (and second questionnaire a year later) combined with twenty detailed case studies, consisting of three visits per year over two years with detailed interviews.

The goal of the analyses was the identification of direct and indirect relationships between the work of effective school heads, changes in school and classroom processes and conditions, and improvements in student outcomes.

One of the primary findings was that school improvement evolved in three phases (early, middle, late), given differences in where schools initially started. Corresponding with these improvement phases, Day et al. (2009) identified four different patterns of successful school leadership, which they labeled (1) coming out of special measures (or sanctions) (2) taking ownership, (3) developing creativity, and (4) everyone a leader. Day and colleagues found certain selected strategies were prioritized across all phases, while others were given special emphasis in particular phases. For example, consistency of teaching practices and performance management of teachers was a primary feature of the early phase, and curriculum enrichment was a common emphasis in later phases. Another key finding was during the middle and later phases of school development, leaders tended to distribute leadership roles and responsibilities more widely, which led to the development of a culture of leadership trust. School heads reported most commonly focusing on improving teaching practices, followed by actions that promoted their school's academic press.

Among the strengths of the study for advancing the field's understanding of leadership and school improvement was the wealth of information collected describing the progressive distribution of leadership across phases and the use of different strategic actions in the development of school supportive conditions within each phase. Future considerations for such longitudinal studies include utilizing a comparison group of schools, perhaps by sampling across the whole spectrum of schools (i.e., including average and low growth schools) to isolate differences in school conditions related to stagnant or declining growth. Researchers might also lengthen the time in which improvement is studied beyond three years, which may not be a long enough time to illuminate fully changes in key theoretical relationships (Goff and Finch, 2016).

Bryk et al. (2010) study

In two longitudinal studies, researchers (Bryk et al., 2010; Sebring et al., 2006) examined nearly 400 neighborhood elementary schools in Chicago for gains in math, reading, and attendance. The studies utilized longitudinal data on students over a seven-year period coupled with parent, teacher, and student surveys that described changes in school processes. Their most detailed analyses focused on some 100 top-quartile public elementary schools in Chicago that improved substantially in reading and math over time contrasted with another set of 100 low-quartile schools with similar contextual factors that remained academically stagnant (Bryk et al., 2010). The researchers developed extensive information on school conditions from over 200 teacher survey questions, 70 student questions, and eight principal questions. The primary findings identified a comprehensive set of school practices and school and community conditions that differentiated high-improving and stagnant schools. In this *best* versus *worst* sample, schools demonstrating weakness on most of the core support indicators were several times more likely to stagnate than schools with strong overall organizational capacity scores. The researchers concluded substantial school improvement required building the social organization within schools and developing capacity across several domains (i.e., school leadership, professional capacity, student-centered learning climate, instructional guidance, and parent-community ties).

Among the strengths of this study for advancing the field's understanding of leadership was the repeated use of surveys to explain changes in school conditions. In their earlier study (Sebring et al., 2006), the researchers used surveys administered on one occasion, approximately in the midpoint of their study, to contextualize "improvement" in student scores. These earlier results were therefore more associational in nature; that is, measuring levels of supports at the midpoint of the study and associating different levels of the essential supports with improved longitudinal outcomes. Importantly, however, their later study provided more detailed information about teachers' work at their schools and utilized repeated surveys at two-year intervals to provide more time-sensitive measures of the school supports (Bryk et al., 2010). This allowed the researchers to confirm their primary findings over multiple replications, which provided a stronger test of time-dependent relationships. Importantly, this also facilitated examining *initial* conditions as related to subsequent changes in school academic improvement and, additionally, how *changes* in school conditions further impacted changes in school academic achievement (Bryk et al., 2010). This formulation was more consistent with theory in advancing a plausible explanation for observed changes in school supports that were related to subsequent changes in achievement. Moreover, replication of results renders alternative explanations of results less plausible. Future considerations for such longitudinal studies include sampling across the whole spectrum of schools, as comparisons between the best and worst maximizes variability that may not be present in other substantial subgroups of schools that could also be compared (Heck and Reid, 2020).

Some other useful designs

As the two previous examples illustrate, longitudinal data have been helpful in separating mediated-relationship studies from direct-effect studies. Specifically, claims of indirect effects of principal actions on outcomes can only be made in the presence of the temporal ordering of variables in a proposed model; for example, with mediators located between exogenous cause and the relevant outcome effects. This is the strongest feature of longitudinal data—the temporal ordering of variables in a proposed model—at least as related to longitudinal non-experimental designs (i.e., similar to the studies in the last section). Longitudinal data collection provides a means of examining how variables may change over time; however, it may not be able to resolve causal relationships entirely (Goff and Finch, 2016; Hallinger and Heck, 2011). In such designs, which are often referred to as *correlational* or *non-experimental* designs since they do not involve treatments, a researcher may observe an upward trend in student math scores over

time and attempt to discover school or classroom settings in which such scores were greater or less than the average trend. Although we may observe such settings with higher or lower math scores over time, we largely lack information regarding the underlying causal mechanisms that produced the observed differences due to a possible intervention, such as a change in day-to-day course delivery in some classrooms or schools that was monitored with respect to its changes in student assessments.

Dynamic theories of organizational processes have several common elements (Blalock, 1989; Kelly and McGrath, 1988). They should outline a broad plausible time parameter associated with the change being observed; they should describe the expected behavior of key variables over time and the interrelationships among variables as a series of equations; and the variables should have continuity (e.g., magnitude, rate of change, form a trend). Recently, Zyphur et al. (2019) introduced a general longitudinal cross-lagged panel model (GCLM), which can expand the conceptual and modeling options for examining relationships between variables changing over time in the absence of specific treatments introduced. GCLM provides expanded ways of thinking about relationships between variables such as leadership and school conditions by avoiding a single direction of causality and, instead, introducing concepts such as mutually-reinforcing (and reciprocal) relationships, as well as by including time lags that are consistent with causality (Hallinger and Heck, 2011; Zyphur et al., 2019). Importantly, the possibility of omitted variables that may change results observed in a particular model are a real possibility.

Quasi-experimental designs

Establishing causal relationships is, in large part, a function of the type of research design one may employ (e.g., experimental designs, quasi-experimental designs), as these latter studies incorporate some type of events (the introduction of a policy, a treatment to improve math proficiency for struggling students) assumed to induce an observable change in a series of longitudinal measurements. The ability to manipulate a type of intervention and to illuminate rival explanations are hallmarks of a strong research design. Time-series (i.e., with several measures before an event and several after) and regression discontinuity (i.e., where we can model the *process* used to assign individuals to groups before a treatment) designs provide viable options where we may use longitudinal data to examine the timing of events and subsequent changes. They can be useful where data are routinely collected over time (e.g., student test scores, school process data).

Quasi-experimental designs have the potential to uncover causal relationships between leadership, strategic interventions, and student improvement without randomized trials (Corcoran et al., 2012; Goff and Finch, 2016). They include the presence of an intervention but without random assignment to groups. The results are indicated by a discontinuity in the repeated measurements recorded at some point after the introduction of the intervention. Importantly, these designs provide greater separation of intended effects from rival explanations not typically afforded by simple longitudinal data analysis, provided certain threats to internal validity can be argued away (Cook and Campbell, 1979). The argument concerns the consideration of plausible rival explanations for any shift in the time series other than the intervention.

For example, Goff et al. (2014) used an interrupted time series to investigate the impact of a feedback and coaching intervention on principals' leadership behaviors (see also Miller's (2013) study on principal turnover). Heck and Moriyama (2010), utilized a regression discontinuity design to examine the temporal ordering of leadership, instructional practices, and added-year effects, net of the context and social composition. Heck and Chang (2017) utilized an interrupted time-series design to examine the timing of changes in key educational process indicators during NCLB in three groups of schools: a comparison group of schools that consistently met achievement targets; a group that entered mandatory restructuring due to prolonged academic failure but failed to exit; and a group that entered restructuring but managed to improve sufficiently to return to good academic standing. The design confirmed different trends in teachers' perceptions of educational processes corresponding to schools' restructuring status—a baseline trend as schools attempted to meet rising yearly performance targets, a trend of punctuated changes in educational processes after entering mandatory restructuring, and a return to relative stability in school support conditions in restructured schools that met yearly targets again and therefore exited restructuring status. The presence of a comparison group that was not restructured enhanced the design by isolating the evidence of change among *treated* groups, and the multiple years of entry and exit reduced the likelihood of incidental events affecting the observed time-series results (Cook and Campbell, 1979). Additionally, Heck and Chang noted the largest perceived change among exiting schools was in the effectiveness of the school's shared leadership and its focus on sustained strategic action for improvement.

Latent variable mixture models

Previous longitudinal studies on school leadership and school improvement suggest the influence of context in implementing changes to improve student learning. Identifying similarities in student achievement among underlying subsets of schools over a substantial period of time is an important step in understanding how different patterns of leadership and capacity building may be required for schools that are in different phases for academic improvement (e.g., Bryk et al., 2010; Day et al., 2009). Latent variable mixture modeling (LVMM) is a relatively under-utilized approach that relaxes the necessity of making "known-group" comparisons of schools' beginning achievement levels and corresponding growth rates. It facilitates identifying subgroups where membership is not known ahead of time but, rather, *emerges* from the data (Muthén, 2001). LVMM facilitates the identification of underlying latent classes, which are characterized by children or schools with similar beginning achievement levels and growth.

Where the latent classes are defined at the school level, it allows researchers to explore population heterogeneity that is caused by school-level variables. The purpose of this type of analysis is to estimate the number and size of the latent classes, assign membership to the classes, and then to identify key predictors of class membership as well as their effects on the differential class growth rates (Asparouhov and Muthén, 2014).

The primary advantage of this type of *emergent* approach for studying school improvement is that, rather than assuming one set of initial status achievement and growth estimates across a sample of schools, LVMM can identify underlying subsets of schools that share similar initial student achievement levels and growth rates within a broad distribution of schools. The approach therefore facilitates the examination of variables explaining population heterogeneity in achievement growth in more diverse samples of school growth compared to more narrow researcher-selected samples (e.g., low-vs. high-growth schools). Recent LVMM studies include Urick (2016) and Bowers et al. (2017), whose latent class analysis illustrates the type of rich contextual analysis of the relationships between teachers and leaders on a multisource survey of school leadership focused on improvement of student learning in schools.

Concluding thoughts

As longitudinal data become more readily available in upcoming years, we should observe their increased use in examining school improvement processes that result in advancing student learning. A key component, however, is the availability of more detailed information from school personnel, parents, and students on conditions in and around school communities that can help contextualize the nature of school-based changes. This provides necessary information regarding changes in processes that can be linked to subsequent changes in student outcomes. Armed with further longitudinal data and stronger research designs (e.g., quasi-experiments, cross-lagged analyses of mutual changes in variables, LVMM) researchers can contribute to improved validity of knowledge claims by reducing the plausibility of rival explanations of results.

Introduction

Reviews of research have a long history in the field of education. Indeed, the education journal with the highest impact factor, *Review of Educational Research* (RER), is devoted exclusively to reviews of research. That said, up until the 1970s reviews of research in education, including those published in RER, tended to be of the *ad hoc* variety. This refers to reviews in which neither the procedures for selecting sources covered in the review nor the methods used to evaluate and synthesize them are made explicit and described in detail (Gough, 2007). However, since the 1970s and 1980s, authors of reviews of research in education have increasingly adopted review methods that fall within the rubric of systematic reviews of research (Foster and Hammersley, 1998; Hallinger, 2013, 2014; Mulrow et al., 1997).

Systematic reviews of research are conducted for a variety of purposes. Scoping and narrative reviews, often conducted when a research field or issue is relatively new, seek to highlight emerging trends and propose fruitful directions for future research (Foster and Hammersley, 1998; Peters et al., 2015; Sucharew and Macaluso, 2019). Critical reviews are undertaken once a body of knowledge has accumulated, with the aim of generating new theory (Paré et al., 2015). Meta-analytic reviews quantitatively integrate findings from a body of studies focused on a specific set of variable relationships with the goal of assessing evidence on impact and effectiveness (Cooper et al., 2019; Lipsey and Wilson, 2001). Bibliometric reviews analyze bibliographic data associated with a large set of documents in order to synthesize patterns of knowledge production related to a discipline or research issue (Zupic and Čater, 2015).

The emergence of these diverse approaches to research review reflects recognition of the critical role that reviews play in summarizing, critiquing, and synthesizing trends in the accumulation of knowledge (Hallinger, 2014; Mulrow et al., 1997). Indeed, Mulrow et al. (1997) referred to research reviews as, “critical links in the great chain of evidence” (p. 389). In recent years, reviews of research have taken on increased importance with the advent of “evidence-based practice” in education (Hallinger, 2014; Parkes et al., 2016), as well as other professional fields (Higgins et al., 2019). Indeed, it is for these reasons that research reviews often feature among the top-cited articles in education journals.

Among the commonly applied methods of systematic review, the bibliometric review is perhaps the least known among educational researchers. Although bibliometric reviews were conducted in education as early as the 1980s (e.g., Budd, 1988), it is only in the past several years that this mode of review has begun to be applied to educational issues with greater frequency (Aparicio et al., 2019; Hallinger and Kovačević, 2019a; Hallinger and Wang, 2020; Marín-Marín et al., 2019; Wang et al., 2017). Thus, we believe that education scholars may benefit from an explicit introduction that clarifies how to assess, interpret and execute bibliometric reviews of research.

In this article, the authors describe the rationale and method behind bibliometric reviews of research. Furthermore, we offer illustrations of bibliometric techniques from several recent bibliometric reviews of educational research. Our goal is to demonstrate the potential of this mode of research review for synthesizing patterns of knowledge production and accumulation in education. Given the increasing frequency of publication of bibliometric reviews in educational journals, readers and reviewers will benefit from a concise analysis of the rationale and methods used in this approach to systematic research review.

Rationale for bibliometric reviews

Scholars have been interested in understanding factors that shape knowledge production in education (Eidel and Kitchel, 1968; Hallinger, 2011; Metcalfe and Fenwick, 2009; Mertkan et al., 2017) as well as other disciplines since the 1960s (Gilbert, 1977; Ikpaahindi,

Fig. 1 Conceptual dimensions of a knowledge base.

1985; Kuhn, 2012; Merton, 1973; Small, 1973, 1999; De Solla Price, 1965). Reviews of research play a central role in this effort as they capture and make sense of knowledge accumulation within specific domains of knowledge. We assert that among existing research review methods, bibliometric reviews offer a unique approach to expanding our perspectives on the knowledge base.

The “knowledge base” in a field of inquiry can be conceptualized in terms of four dimensions (see Fig. 1). “Size” of the knowledge base refers to the volume of published research in the field or on a given topic. This takes note of the fact that the advancement of knowledge requires the accumulation of a critical mass of theory and empirical research. While the size of a knowledge base does not directly equate to knowledge advancement, it can be conceived as a necessary but insufficient condition for the development of a discipline or a line of inquiry with it.

“Time” is measured in terms of the publication trajectories that accrue on particular topics, or for the field as a whole, as the knowledge base evolves over time. Longitudinal analysis of the knowledge base enables scholars to connect current trends to past findings and codify important changes in our understanding of phenomena. This keeps scholars humble and highlights the relative breadth and depth of the knowledge base as it accumulates over time.

The “spatial” distribution of a literature can be analyzed in terms of the geographical origins of scholarship within a field. This addresses the question, “to what extent is scholarship in this field widely distributed across the world, or concentrated within a smaller number of societies?” Additional insights can be gained by analyzing the geographical distribution of a knowledge base in concert with its size and publication trajectories. This acknowledges the fact that knowledge is socially and culturally constructed, and highlights the critical goal of developing a knowledge base in education that is globally relevant and valid.

“Composition” refers to the “intellectual structure” of the knowledge base. Zupic and Čater (2015) defined intellectual structure as, “the examined scientific domain’s research traditions, their disciplinary composition, influential research topics, and the pattern of their interrelationships” (p. 435). Composition can be analyzed by reference to key documents, authors, and journals that come to be located within a knowledge base as it emerges and evolves.

Bibliometric reviews of research have the capability to gain insight into these dimensions of a knowledge base. As noted above, bibliometric reviews aim to synthesize patterns of knowledge accumulation and production through systematic means of document identification, analysis and synthesis (Hood and Wilson, 2001). As such, bibliometric reviews leverage advancements in software development (Pan et al., 2018; Van Eck and Waltman, 2009, 2017) such that reviewers are able to examine much larger document samples than are typically analyzed through other review methods.

Indeed, this capability to work with “big data” separates bibliometric reviews from other review methods. For example, in a recent bibliometric review of research on educational leadership and management, the authors used bibliometric tools to analyze 22,361 Scopus-indexed documents published over the course of 60 years (Hallinger and Kovačević, 2019b). Indeed, Waltman (March 12, 2020, Personal communication) suggested 200 documents as the “minimum document sample size” needed to reveal viable patterns for some analyses in a bibliometric review. Of course, reviews that encompass such large document samples must sacrifice depth of document examination for breadth (Hood and Wilson, 2001). This is the case with bibliometric reviews which are designed to reveal broad patterns of knowledge production and accumulation within a conceptual domain rather than evaluate specific findings.

Identifying a document database for bibliometric review

In a bibliometric review, the author begins by conceptualizing the topical focus. This is followed by a systematic search for relevant documents in a document repository such as the Web of Science, Scopus, Dimensions, or Clarivate. Google Scholar is less often used

for bibliometric reviews due to its limited capacity for exporting bibliographic data in a form that can be analyzed by bibliometric software packages.

We assert that selection of the “best” document repository is a field-dependent decision. For education and the social sciences, comparative empirical analyses have found that Scopus offers far more comprehensive coverage of “relevant journals” than the Web of Science (Falagas et al., 2008; Mongeon and Paul Hus, 2016). We learned this lesson from experience when conducting our first bibliometric review in educational leadership and management (EDLM). Whereas the Web of Science included only three of the “nine core EDLM research journals”, Scopus included all of them. Therefore, a review of EDLM research that relied on the Web of Science for the identification of the review database would fail to yield a valid picture of this field of study (see Hallinger, 2020b; Hallinger and Kovačević, 2019a).

As is with any systematic review, the reviewer must next decide which “document types” to include in the review. Relevant options offered by the major document repositories include journal articles, books, book chapters, conference papers and conference proceedings. There is no one right option in terms of which of these to include in a review. Indeed, highly-cited reviews can be identified that were limited to journals, as well as ones that included multiple document types.

Although many reviews limit the document sample to journals due to more consistent quality checks, we suggest that this is also a field dependent decision. In fields such as technology and engineering, conference papers undergo rigorous review and form an integral portion of the knowledge base. In other fields, including education, conference papers are often less central to the knowledge base. It should be noted that neither the Web of Science nor Scopus include broad coverage of books. The key point is that the reviewer should consider and explicitly justify the reasons for selecting the particular types of documents included in a bibliometric review.

The next step is to generate the “document list” in the selected document repository. Bibliometric reviews either define an explicit set of “search terms” to generate a document list, or select a delimited set of journals from which to source documents. At first glance, the comprehensiveness of the first approach would seem to make it the preferred choice. For example, one of the authors recently conducted a review of research on problem-based learning (PBL) for which the keyword-based search option was quite straightforward and yielded a comprehensive document list with relatively few ambiguities (Hallinger, 2020a).

However, for many topics, it is difficult to arrive at a set of search terms that yields a sufficiently coherent and accurate document list. In such instances, bibliometric reviewers may choose to identify a limited set of key journals for which it can be assumed that “all published documents” are relevant to the topic of the review. The authors used this approach in our review of research on educational leadership and management (EDLM), a topical domain that turned out to be exceedingly difficult to capture reliably via a keyword search (Hallinger, 2020b; Hallinger and Kovačević, 2019a).

In this case, the authors identified 22 Scopus-indexed journals that publish exclusively within the field of EDLM. Instead of using a keyword-based search, we simply exported from Scopus data associated with “all of the articles published by the 22 journals”. Although this approach resulted in the “omission” of many relevant EDLM documents published in general education and management journals, the authors were able to make a convincing argument that the 22,361 articles sourced from the 22 EDLM journals offered a sufficiently comprehensive and valid picture of the EDLM field. Note again that bibliometric reviews exploit “big data” in order to portray broad trends. Therefore, the omission of other EDLM papers that fell outside our database was determined to be non-significant.

If, however, a keyword-based search approach is adopted, the reviewer will use the conceptual definition of the review’s topical focus to guide the selection of a set of keywords. These will be input into the search engine using a combination of AND/OR/NOT operators in order to generate a document list. Other “boundaries” may also be set for the search (Hallinger, 2013). For example, if the review is conducted for a particular time frame, the researcher will enter the start and end dates into the search engine. Alternatively the review may be set up to be open-ended. If the review is delimited to a particular region or country, geographical search terms may also be defined.

We wish to reiterate that keyword-based searches vary widely in their efficiency. Authors cannot simply assume that the list generated by Scopus or the Web of Science is valid. It is likely in virtually all cases that the search engine has included irrelevant documents and omitted other relevant ones. Indeed, the authors have seen Scopus searches that generated 7000 plus documents reduced to 1200 after document inspection, filtering and elimination based on duplication and relevance.

Due to the critical nature of the document database, bibliometric reviews typically follow PRISMA guidelines for reporting the procedures used to identify the review database in systematic reviews (see Moher et al., 2009). This means that reviewers must keep a careful record of the search sequence and the results as documents are filtered and eliminated. This pertains directly to the “repliability” of the systematic review.

We reemphasize that due to the nature of a bibliometric review, special care must be taken to ensure that the document list generated by the search engine offers a “valid picture” of the knowledge base. A valid review database should meet several criteria. First, as indicated above, selection of the source document repository data must be justified on the criterion of “coverage of relevant sources”.

Second, the reviewer must ensure that the document list contains few to no “irrelevant documents”. For example, in the aforementioned bibliometric review of research on PBL (Hallinger, 2020a), the document list generated by the Scopus search included studies of a genetic compound abbreviated as “PBL”. All of these documents had to be deleted individually from the Scopus list after a careful inspection of titles and abstracts. Depending upon the “ambiguity” of the search terms, the number of documents to be eliminated will vary from relatively few to many.

Finally, concerns for validity should also prompt the reviewer to ask, “have I captured all of relevant documents contained in the document repository?” The frequency with which search engines omit potentially relevant documents is actually quite surprising. The researcher can search the data repository on the names of key authors in the field and compare the results with the initial list in order to determine if relevant papers are missing. If they are, a supplementary search may be undertaken using alternative search terms in order to address the shortcomings of the main search.

These observations suggest that keyword-based searches run the gamut from clear to ambiguous, depending upon the topic. Recently a colleague asked us to consult on a bibliometric review of bilingual education. Rather quickly it became apparent that this would be a difficult topic to capture through a keyword search. We advised that it would likely take several weeks to search and filter the results before arriving at a valid list in Scopus, if indeed that were possible.

Once the researcher has developed a solid document list, the “bibliographic data” describing the documents are exported from the repository into an intermediate file format (e.g., MS Excel or text file). As noted, the “data” analyzed in a bibliometric review do not consist of research findings. Rather they consist of “bibliographic data” that describe features of the selected research documents. These “data” typically include author(s) names, author(s) locations, author(s) affiliations, document title, document source, date of publication, citation data, co-citation dates, keywords, abstract, and funding sources.

Some descriptive analyses can be performed in Excel, but data will need to be uploaded into a bibliometric software package for the main bibliometric analyses. Currently popular software packages include VOSviewer, Citespace, BibExcel, HistCite, Pajek, Netdraw, and Publish or Perish. For the purposes of this article, the authors will use the VOSviewer (Van Eck and Waltman, 2009) program and the Scopus data repository to illustrate techniques of bibliometric analysis.

It should also be noted that the accurate execution of bibliometric analyses requires one additional step prior to data analysis, the “disambiguation of names and terms” (Strotmann and Zhao, 2012). Although space limitations preclude a detailed explication, suffice it to say that the author must take a series of steps to ensure that the bibliographic data do not contain “overlapping keywords” such as “student” and “students”, or author names such as Heck, R. and “Heck, R.H”. Otherwise the results of bibliometric analyses will be unreliable. These steps are described in detail elsewhere (Strotmann and Zhao, 2012; Van Eck and Waltman, 2013).

Bibliometric analyses: explanations and illustrations

Bibliometric analyses can be broadly classified into descriptive and science mapping analyses. Descriptive analyses focus on identifying basic trends in knowledge production. Science mapping applies network analysis techniques to illustrate “relational patterns” in the knowledge base.

Descriptive bibliometric analyses

When applied to large data sets, even simple descriptive analyses can offer useful insights with respect to the size, growth trajectory, and spatial distribution of a literature. For example, Hallinger (In press) used bibliometrics to review 14,130 Scopus-indexed documents related to problem-based learning. Simply finding a knowledge base of that size suggested that PBL has evolved from being an innovation in medical education initiated during the 1970s and 1980s to a mainstream form of learning. In order to gain further perspective on the magnitude of this knowledge base, the author ran simulated Scopus searches on “case teaching”, “cooperative learning”, “project-based learning”, “flipped classroom”, and “simulations and serious games”. Searches on these alternative forms of active learning yielded between 2000 and 4000 documents, thereby affirming the substantial scope of research and theory that has accumulated on PBL.

Analyzing the growth trajectories of published knowledge associated with a discipline, a field of study or a research topic represents another useful means of documenting the evolution of knowledge. For example, Hallinger and Kovačević (2019a,b) documented the growth of the EDLM knowledge base from its emergence as a field of study in the 1960s to the present. The authors found that the decade by decade growth trajectory of articles published in key Scopus-indexed journals rose continuously from 1544 articles in the 1960s to over 5000 articles between 2010 and 2019. Analysis of growth trajectories also provides a basis for predicting the future growth or decline of a field or a topic.

If our goal is to build a knowledge base in education that is both globally relevant and valid, then theories, policies and practices must be studied in diverse contexts (Hallinger, 2011, 2020b). Thus, geographical analysis of the distribution of articles in a knowledge base is highly relevant. The analysis of size, growth trajectories and geography can also be combined in order to document changes in the distribution of knowledge production over time. Hallinger (2020b) disaggregated the EDLM global knowledge base by regions of the world. Then he graphically depicted the longitudinal pattern of change in the proportion of the knowledge base generated in Anglo-American-European societies versus the “emerging regions” of Asia, Africa and Latin America (see Fig. 2). This analysis highlighted the unbalanced production of knowledge from the 1960s to the 2000s, with the global EDLM knowledge base dominated by Anglo-American-European studies (see Fig. 2). However, the graph shows a clear paradigm shift in the field starting in the late 2000s with more and more literature being produced in the emerging regions. This graph suggests that the center of gravity in the knowledge base has begun to shift with increasing contributions from scholars in the emerging regions of Asia, Africa and Latin America. Findings such as these have implications both for the selection of research topics and for journals which vary in their receptivity to “non-traditional” sources of knowledge (Hallinger, 2011, 2020b).

Fig. 2 Comparison of change in EDLM publication volume over time within and across different regions of the world, 1965–2018 ($n = 1171$ studies). Reproduced with permission from Hallinger (2020b), p. 2018.

We also include author and journal productivity as forms of descriptive data analysis. These productivity analyses measure the frequency of contributions of specific authors/journals to a literature. This offers insight into key contributors to a particular literature. Moreover, this type of metric becomes even more useful when combined with the results of author/journal citation and co-citation analyses.

Citation data related to authors, documents and journals are included in the Excel file exported from Scopus and Web of Science and can be analyzed either in Excel or with bibliometric software packages (e.g., VOSviewer). These citation data describe the number of times that an author/document/journal has been cited in documents included in the main document repository (i.e., Scopus, Web of Science) and are, therefore, referred to as “Scopus citations” or “Web of Science citations”. It should be noted that Scopus citations are usually larger than those generated by the Web of Science, but smaller than those yielded by Google Scholar due to differences in the size of the respective indexes.

Scholars have traditionally used citation analysis as a means of documenting the “impact” of prominent authors, documents, and journals within a domain of knowledge (Gilbert, 1977; Merton, 1973; Small, 1973). Merton asserted that citation metrics are used to, “prove the historical lineage of knowledge and to guide readers of new work to sources they may want to check or draw upon themselves” (1979, p. VI). Bibliometric scholars widely accept that frequently cited authors/documents/journals have made significant contributions to the advancement of knowledge (Hood and Wilson, 2001). This proposition rests on the assumption that authors cite other scholars or documents which contain ideas that contribute to their own work (Gilbert, 1977; Hood and Wilson, 2001; Small, 1973).

Citation analysis has been critiqued on various grounds (Weingart, 2005). Nonetheless, it remains a key metric used to gain insight into the “impact” of authors/documents/journals on knowledge accumulation (Zupic and Cater, 2015). However, we suggest that findings from citation impact analysis are best understood when assessed in concert with the results of other metrics such as author productivity, author and document co-citations (e.g., Hallinger and Kovačević, 2019a).

A variety of other descriptive analyses can be conducted focusing on patterns of funding sources, the frequency and distribution of universities that have contributed to a field of study, disaggregation of the knowledge base by subject area/discipline, and analysis of the distribution of types of documents (e.g., journal article, book, book article, conference paper). Space limitations preclude in-depth description of these analyses.

Science mapping

Advances in text mining and citation analysis have enabled bibliometrics to provide deeper and more comprehensive analyses than was possible in the past (Chen and Chen, 2003; Cobo et al., 2011; Van Eck and Waltman, 2017; Wang et al., 2017). Broadly referred to as “science mapping”, these approaches to data synthesis are capable of illuminating “relational features” of the knowledge base in a discipline (Cobo et al., 2011; De Solla Price, 1965; White, 2004; Zupic and Cater, 2015). These include co-citation analysis of authors/documents/journals, keyword co-occurrence analysis, bibliometric coupling, and co-author analysis (Ikpaahindi, 1985; Wallin, 2005; Van Eck and Waltman, 2014, 2017; Zupic and Cater, 2015). In this section of the article we define and illustrate several of the most common science mapping techniques (for information on other science mapping analyses see Zupic and Cater, 2015).

Co-citation analysis

In contrast with traditional citation analysis which scans the mother database" (e.g., Scopus or Web of Science), co-citation analysis assesses the frequency with which authors/documents/journals have been cited in the "reference lists of the review documents" themselves. This difference in the "source" of citations is fundamental to understanding one of the key difference between citation and co-citation analysis. Whereas citation analysis reveals "impact" on the broader literature, co-citation analysis reveals sources of "influence" on scholars working within a given field. Although there is always some degree of overlap between the results of citation and co-citation analysis, co-citation analysis typically reveals scholars/documents/journals from outside the field under review that have shaped the thinking of scholars working in the field under review.

For example, in Hallinger and Wang's (2020) bibliometric review of research on simulations and serious games, author co-citation analysis identified a group of highly cited cognitive and social psychologists (e.g., Bandura, Bransford, Brown, Wenger), none of whom had ever published an article on simulations and games. Thus, none of them appeared in the review database. Even so, their frequent citation in the reference lists of the review documents documented the influence of their learning theories on research into how and why simulations and games operated as modes of learning.

Similarly, in our bibliometric analyses of EDLM research (Hallinger and Kovačević, 2019b), we identified highly influential management and psychological theorists, none of whom had published articles in EDLM books or journals (e.g., Avolio, Bandura, Bass, Blau, Etzioni, Herzberg, Merton, Parsons, Simon). Yet, their theories of leadership and social organization provided the theoretical basis for understanding issues of leadership and management in schools.

While these examples have focused on "authors" as the unit of analysis, similar techniques and principles also apply to document and journal co-citation analysis. For example, the Hallinger and Kovačević (2019b) review identified Karl Weick's publication on schools as loosely coupled organizations published in the *Administrative Science Quarterly* as the "most highly co-cited article" in the field. This was despite the fact that the article had not been published in one of the "core EDLM journals" included in the review. Thus, we again emphasize that co-citation analysis offers insight into the "influence" of authors/documents/journals on scholarship in the knowledge domain under review, as opposed to the "impact" of scholars/documents/journals in the field on the broader literature.

Co-citation analysis also offers the capability to "visualize relationships" among authors/documents/journals cited within the knowledge domain under review. Small (1973) defined co-citation as the frequency with which two "units" (e.g., authors, documents, journals) are cited together in the reference lists of the review documents. In co-citation analysis the bibliometric software also calculates the frequency with which "pairs of authors/documents/journals" are cited together in the reference lists of the review documents (White and McCain, 1998; Zupic and Čater, 2015). For example, in each instance that the software finds a co-citation of two authors by a third author, each of the cited authors gains one "co-citation" and the pair accrues a "link".

For example, in Hallinger's (2020a) bibliometric review of PBL research, author co-citation analysis identified Howard Barrows and Henk Schmidt as "frequently co-cited authors" in this literature. This meant that documents included in the PBL review database which cited Barrows also frequently cited an article authored by Schmidt as well. Bibliometric scholars assume that frequently co-cited scholars/documents/journals bear an intellectual relationship or similarity (Small, 1973; McCain, 1986; Zupic and Čater, 2015). Such was the case with Barrows and Schmidt, each of whom was distinguished by his pioneering efforts at defining and designing PBL as a mode of learning.

Bibliometric software leverages this relational tendency by drawing on co-citation data to provide a visualization of similarities (VoS) among authors/documents/journals in a social network map. More specifically, co-citations and links are tracked by the bibliometric software, added into a matrix, and then transformed into a network map (Van Eck and Waltman, 2009, 2014). These visual maps of the literature allow us to gain insights into the relational structure of a knowledge base.

In order to illustrate these features of co-citation analysis, the authors ran author co-citation analysis for the Scopus-indexed EDLM literature published between 1960 and 2018 (see Fig. 3). The map in Fig. 3 is interpreted using several guidelines. First, the "size" of the author nodes reflects the relative number of co-citations accumulated by the author. On this map largest nodes belong to the three most frequently co-cited authors: Ken Leithwood (4091 co-citations), Philip Hallinger (2834), Alma Harris (2038). Based on the threshold used to create this map, the smallest nodes on the map indicate ~300 co-citations (e.g., Goddard, Printy, Silins).

The next interpretive guideline concerns the "proximity" of nodes to one another. Nodes located in close proximity bear a close co-citation relationship, and therefore, suggest a strong intellectual similarity between the relevant authors. For example, observe the proximity of Ken Leithwood and Philip Hallinger, Michael Fullan and Andrew Hargeaves, Charles Teddlie and Sam Stringfield, and Wayne Hoy and Megan Tschannen-Moran. Each of these pairs of scholars is noted for working along a similar theoretical line of inquiry. Their positions on the map reflect these close co-citation relationships empirically derived from the reference lists of the review documents.

The map also shows lines or "links" connecting pairs of authors, which as explained above, is based on their co-citation by other scholars. "Dense" links suggest a higher number of co-citations of the paired scholars. Examination of the pattern of links also offers insight into the location and breadth of influence of a scholar.

Finally, the map organizes the authors into colored "clusters" based on co-citation patterns. The author of a science mapping review must draw upon "tacit" knowledge of the field in order to identify the nature of the commonality in theoretical perspective among authors within a given cluster. Then the author will name the clusters as "schools of thought" or key theoretical streams that

Fig. 3 Author co-citation map of educational leadership and management literature, 1960–2018 ($n = 22,361$ articles in 22 Scopus-indexed journals).

have emerged over time within the literature. This process is analogous to the process by which scholars interpret the output of exploratory factor analyses.

The map in [Fig. 3](#) highlights five schools of thought in the overall EDLM literature: Principal Leadership for Learning, Leading Teachers, Leading School Culture and Change, School Effectiveness and Improvement, Shared Leadership for Learning. These five schools capture the key theoretical directions that have evolved within this field of study during the period under review. Co-citation maps vary both in the number of clusters that emerge on a map, as well as in their degree of “coherence”.

Although the map in [Fig. 3](#) is reasonably coherent, there is some overlap between selected clusters (e.g., purple and blue, red and yellow). For example, notice that although James Spillane’s node is physically located in the Principal Leadership for Learning school, the software has assigned him, by color, to the Shared Leadership for Learning school. This reflects the fact that Spillane has published a critical mass of co-cited scholarship in both domains. Co-citation maps formed in this way have been found to provide valid conceptual depictions of disciplines ([Chen and Chen, 2003](#); [McCain, 1986](#); [Van Eck and Waltman, 2014](#)).

Synthesis of these varied features of a co-citation map can yield a range of different observations and conclusions about the nature of the knowledge base under review. For example, note that a scholar’s influence can be located primarily within his/her own cluster or school of thought (e.g., Creemers, Hanushek, Gunter) or distributed broadly across multiple schools (e.g., Leithwood, Fullan, Spillane, Murphy). Scholars with numerous links distributed across multiple clusters have been referred to as “boundary spanning scholars” whose theoretical work has shaped the field.

Because knowledge accumulation is a dynamic process, co-citation maps have also proven useful in charting evolution in the conceptual foci studied in a field over time. For example, the authors created a longitudinal series of author co-citation maps depicting the evolution of the EDLM literature over a period of six decades from the 1960s to the 2010s ([Hallinger and Kovačević, 2019b](#)). During the 1960s and 1970s, the author co-citation map revealed a lack of coherence, low author population, relatively low rates of co-citation, and few substantive themes related to the practice of educational administration. Instead, the named schools of thought tended to suggest a focus on administrative and organizational theory in education. At the same time, however, two small disconnected schools of thought had begun to emerge focusing on Organizational Change in Schools and Socio-economic Effects of Education. Subsequent maps revealed the growth of these two schools into more significant schools of thought associated with Leading School Culture and Change, and School Effectiveness and Improvement. Moreover, comparison with maps of subsequent

decades revealed a clear paradigm shift in the field occurring in the early 1980s with the advent of a new focus on leadership for teaching and learning (Hallinger and Kovačević, 2019b).

Hallinger (2020a) generated a series of longitudinal maps of the literature on problem-based learning for a similar purpose. These revealed significant stability in the foci of PBL scholarship over time with continuity of interest in PBL design and implementation as well as PBL effects on learners. At the same time, the maps also documented the evolution of an early school of thought associated with Cognitive Learning Theory into a broader domain concerned with Active Learning in Education (Hallinger, 2020a). This documented the increasing integration of other modes of active learning into PBL (e.g., flipped classroom, cooperative learning), as well as the increasing influence of PBL on other methods of learning.

The results of author co-citation analysis can also be interpreted in concert with other analyses. For example, tables that show the most productive scholars (i.e., frequency of contributions to the literature), citation impact, and co-citation influence offer multiple, complementary perspectives on author impact (see Tables 2 and 3 in Hallinger and Kovačević, 2019a, pp. 349–350). Taking these varied data into account, bibliometric scholars have identified “canonical scholars” and “canonical documents” which represent key authors/publications that have sustained high levels of impact and influence on a field across several decades (Hallinger and Kovačević, 2019a; White and McCain, 1998). Aside from recognizing key contributors to a literature, the identification of canonical scholars and documents offers a means of fast-tracking new entrants to key sources in a literature.

Keyword co-occurrence analysis

Keyword analysis has also emerged as another favored form of science mapping (Ding et al., 2001; Giannakos et al., 2020; Klavans & Boyack, 2017; Kovačević and Hallinger, 2020; Wang et al., 2017). This is a variant of text mining which uses keywords as a means of identifying topical trends within a literature. Notably, and in contrast to other bibliometric analyses, keyword analysis draws upon actual text located in the documents, which makes it a lower inference method of analysis. There are several approaches to keyword analysis that can be applied in a bibliometric review.

First, keyword analysis conducted in VOSviewer tracks the simple frequency with which keywords appear in the titles, abstracts and keyword lists of documents contained in the reviewer’s document list. Analysis of keyword frequency offers insight into the most popular topics studied within a literature.

Second, keyword co-occurrence analysis or “co-word analysis” visualizes relationships among keywords in a manner that is similar in principle to co-citation analysis. Van Eck and Waltman (2014) stated that, “The number of co-occurrences of two keywords is the number of publications in which both keywords occur together in the title, abstract, or keyword list” (p. 289). The analysis asks, “what topics are frequently studied together in this literature?” For example, in our EDLM review, the authors found that prior to 1980s “leadership” and “learning” seldom appeared together in the titles, abstracts, or keywords of the review documents. Yet during the post-1980s years, these two keywords “co-occurred” frequently.

Co-word analysis has been used to visualize the “conceptual space” of different literatures (Ding et al., 2001; Giannakos et al., 2020; Hallinger and Chatpinyakoo, 2019; Hallinger and Wang, 2020; Zupic and Čater, 2015). By way of example, the co-word map in Fig. 4 visualizes the literature on higher education for sustainable development (Hallinger and Chatpinyakoo, 2019). This map reveals three main conceptual themes within this literature: Curriculum and Instruction, Triple Bottom Line of Sustainability, Managing Universities Sustainability. The authors named these conceptual themes through a synthesis of tacit knowledge and keyword clustering.

A third approach to keyword analysis employs a ‘temporal overlay’ on the basic co-word map shown above in Fig. 4 (Van Eck and Waltman, 2014). Temporal co-word analysis links each keyword’s occurrence to the publication year of the associated documents (Van Eck and Waltman, 2014). VOSviewer software, for example, creates a distribution of publication dates for each keyword and then calculates the mean year for the distribution (Ludo Waltman personal communication, February 10, 2020). Distributions that center on a more recent year highlight topics of more current interest. A temporal co-word map differentiates the “relative recency” of keywords through color coding (see Fig. 5). As suggested above, this provides another lens through which to reveal longitudinal patterns in the topical evolution of a knowledge base.

Temporal co-word maps enable a more systematic documentation of changes in the topical foci of scholarship in a field over time (Hallinger and Wang, 2020; Van Eck and Waltman, 2014; Zupic and Čater, 2015). The temporal co-word map in Fig. 5 extends the previous figure by highlighting the time frame in which a key word was popularized. This particular review of research ran from 1998 to 2018. Therefore the dark shaded keywords reflect topics that emerged during the earlier years of the review and lighter shaded keywords over the past decade. Temporal co-word analysis has also been used to identify the “research front” or cutting edge topics of interest within a field of study or line of inquiry (Hallinger, 2020b; Hallinger and Chatpinyakoo, 2019; Hallinger and Wang, 2020; De Solla Price, 1965; Zupic and Čater, 2015).

Discussion

Bibliometric reviews of research have emerged as an increasingly popular complement to other forms of systematic review. Among extant review methods, we believe that bibliometric reviews are best suited to gaining an empirically-based, replicable, multi-faceted perspective on knowledge production within a field of study or a particular line of inquiry. Bibliometric reviews have the potential

Fig. 4 Co-word map of literature on higher education for sustainable development, 1998–2018 ($n = 1459$ documents; threshold 9 co-occurrences).

Fig. 5 Temporal overlay on a co-word map of literature on higher education for sustainable development, 1998–2018 ($n = 1459$ documents; threshold 9 co-occurrences).

to depict the theoretical evolution of a literature, identify paradigm shifts in a field of study, highlight key topics of current interest, reveal gaps in the production of knowledge, and point scholars toward the most important literature, scholars, and journals in a field of study.

It should be emphasized that the findings reported for the different bibliometric analyses often complement one another. For example, when the results of author productivity, citation and co-citation analysis are synthesized, they produce a multifaceted perspective on author influence and impact within a given literature. Similarly, combinations of analyses can be synthesized to gain insights into how scholarly capacity and contributions have been distributed geographically around the world and how they have changed over time (Hallinger, 2020b).

These capabilities of bibliometric reviews both complement and extend findings from knowledge base-oriented reviews that rely on narrative analysis, content analysis, and critical mapping. For example, the series of bibliometric reviews of the EDLM literature undertaken by the authors of this article (Hallinger, 2020b; Hallinger and Kovačević, 2019a,b) yielded perspectives and findings that both complemented and extended findings reported in prior studies of the EDLM knowledge base (e.g., Donmoyer et al., 1995; Gunter and Ribbins, 2003; Oplatka, 2010; Ogawa et al., 2000).

At the same time, as highlighted earlier, bibliometric reviews yield a “high inference” view of the field under review. They neither evaluate the quality of research through document inspection, nor are they concerned with the synthesis of specific findings from individual studies (Wallin, 2005). Thus, bibliometric reviews serve an explicit niche in the array of systematic review methods (Hood and Wilson, 2001).

We also wish to highlight three criticisms that have been lodged at bibliometric reviews. First, some authors of bibliometric reviews fail to take sufficient measures aimed at ensuring the validity of the database that forms the foundation of the review. The quantitative nature of this review approach can lead to a false sense that all is well, even when the underlying database fails to meet the desired standard. This is consistent with the “garbage in, garbage out” critique leveled at some meta-analytic reviews. The difference is that in this case the “garbage” does not lie in the quality of the studies included in the review, but rather in the validity of the database constructed for the review. This criticism reinforces the requirement that authors of bibliometric reviews offer a full, detailed explication and justification of the methods used to source the review database (Hallinger, 2013; Wallin, 2005).

Second, the authors have reviewed numerous bibliometric reviews of research that lacked sufficient depth in their conceptualization of the topic and/or interpretation of the analyses. Some authors simply pick a topic, draw a document sample, and execute the full array of analyses that can be run with the software package. The result is a series of tables and graphs that lack the benefit of context and meaningful interpretation. While this is not a limitation of the review methodology *per se*, it highlights a trap that scholars conducting bibliometric reviews can fall into all too easily. Thus, we reiterate that the analyses selected for use in a bibliometric review should be based upon a set of justified research questions, be limited in scope, and accompanied by copious thoughtful interpretation.

Finally, despite the seeming precision offered by this form of quantitative review, an author with limited knowledge of the literature will find it difficult to “make sense” of co-citation and co-word maps. At the same time, the authors have also found that conducting bibliometric reviews of a topical domain is an excellent learning experience, both for PhD students and scholars expanding their interests into a new domain. Here the “challenge” of interpreting a document or author co-citation map will lead the scholar to identify and engage specific literature that has been “validated” as valuable by other scholars. Similarly, journal citation and co-citation analyses offer specific guidance as to most receptive journals for the topic, as well as their ranking and rigor. Thus, we assert that the output of bibliometric reviews holds real value for the development of scholarship and gaining insights into the nature and evolution of the knowledge base.

EDITORS IN CHIEF – BIOGRAPHIES

Robert J Tierney

Rob Tierney is an international educator whose passion is for developing research partnerships to address local literacy needs with educators in different countries. Rob began his career as a classroom teacher in Australia, then proceeded to work in the United States, Canada, Australia and China. He is Dean Emeritus and Professor Emeritus of Language and Literacy Education at the University of British Columbia, the former Dean and Honorary Professor of the Faculty of Education and Social Work at University of Sydney, and a Distinguished University Professor at Beijing Normal University. In the United States, he has served on the faculties of the University of Illinois, University of Arizona, The Ohio State University, Harvard University, and the University of California. Rob has written a number of books and numerous articles on literacy especially related to global issues, diversity, and literacy development. His most recent book was entitled *A History of Literacy Education: Waves of Research and Practice* published by Teachers College Press in 2021. During his tenure as an educator, he has served as the President of the International Literacy Association, President of the Literacy Research Association, an Editor for the *Reading Research Quarterly*, the President of the Association of Canadian Deans of Education/ L'Association Canadienne des Doyens et Doyennes d'éducation, as well on a number of committees and boards for professional groups and government and nongovernment

agencies. In addition, he has been involved on a range of groups on projects globally including in Africa and Asia including for UNESCO, Children's Television Workshop, and Apple Computer.

Fazal Rizvi

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely, and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge 2010) is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge 2022) has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

**Kadriye Ercikan**

Kadriye Ercikan is Vice President of Research and Measurement Sciences at the Educational Testing Service and Professor Emerita at the University of British Columbia. She is responsible for ETS's foundational and applied research and psychometric support of ETS's major testing products and contracts, and the NAEP contract for ETS. Her research focuses on validity and fairness issues and sociocultural context of assessment. Her recent research includes validation of score meaning using response processes, use of response process data for comparing groups and examining fairness and validity of interpretation, and use of scores from artificial intelligence-based automated scoring.

Ercikan is a Fellow of the International Academy of Education. Her research has resulted in 6 books, 4 special issues of refereed journals, and over 100 publications. She was awarded the AERA Division D Significant Contributions to Educational Measurement and Research Methodology recognition for another

coedited volume, *Generalizing from Educational Research: Beyond Qualitative and Quantitative*

Polarization, and received an Early Career Award from the University of British Columbia. Ercikan has been selected to serve as the NCME Book Series Editor (2021–2026).

EDITORIAL BOARD

Jason Beech

School of Education Culture and Society, Faculty of Education, Monash University, Melbourne, Australia

Qing Gu

UCL Centre for Educational Leadership, UCL Institute of Education, University College London (UCL), London, United Kingdom

SECTION EDITORS

Jason Beech is Associate Professor (Global Policy) at the University of Melbourne and visiting professor at Universidad de San Andrés in Buenos Aires where he holds a UNESCO Chair in Education for Sustainability and Global Citizenship. He is senior researcher of the National Council for Scientific and Technical Research of Argentina (CONICET), and Associate Editor of *Education Policy Analysis Archives*. He has been a member of the Board of Directors of the Comparative and International Education Society (2014-2016). Jason has published extensively on the globalization of knowledge and policies related to education. He has also written and is passionate about the challenges of educating for global citizenship and a sustainable future. He has taught in several universities in the Americas, Europe and Australia.

Professor Qing Gu is Director of the UCL Centre for Educational Leadership and Professor of Leadership in Education. She is the Past Chair of the *British Association of Comparative and International Education* (BAICE), Co-Editor of *Teachers and Teaching: Theory and Practice*, Associate Editor of *International Journal of Educational Development*, a member of the Research Standing Committee of the World Council of Comparative Education Societies (WCCES), and a member of the Research Evidence and Impact Panel for the Leadership College for UK Government. Professor Gu has directed and codirected many government and research council funded projects in the areas of teacher professional development, school improvement, and systemic reform and change. She has led a £1.9 m UK Economic and Social Research Council (ESRC) funded project *Schools as Enabling Spaces to Improve Learning and Health-Related Quality of Life for Primary School Children in Rural Communities in South Africa*. Some of her books have been translated into Chinese, Japanese, and Spanish.

Professor Smith is a New Zealand Maori of Te Aitanga a Hauiti, Ngati Porou, Kati MamoeNgati Apa, Ngati Kahungunu descent. He is a highly regarded and internationally recognized, Maori educationalist and scholar. He has been at the forefront of transforming Maori and Indigenous social, economic and cultural conditions through re-developing education and schooling outcomes. His work links theoretical thinking and practical applications within an ongoing cycle of transforming praxis.

Professor Smith trained as a teacher at Auckland Teachers College and taught in Auckland schools. He also lectured in Education at the Auckland College of Education. He was one of the first teachers and developers of a Kura Kaupapa Maori, an alternative, Maori philosophy and principles-based School. These Maori immersion schools have grown from a single entity in 1988 to over seventy-five publicly funded schools in 2015. His theoretical leadership in the Education Department at the University of Auckland helped inform the emergence of Maori Education as a distinct field of study across the New Zealand Tertiary Sector. This work has encouraged a wide range of academic studies focused on overthrowing persisting inequities within and as a result of education and schooling in New Zealand. His significant contribution to New Zealand education is to be seen in his work related to Kaupapa Maori as a theory of Transformative Praxis. All of these elements derive from his PhD research entitled, "The Development of Kaupapa Maori: Theory and Praxis (1997)".

Professor Smith's later academic work centered on developing theoretically informed strategies related to transforming high and disproportionate levels of Maori cultural, political, social, educational, and economic marginalization. He has been a significant scholar involved in the emergence of Tribal "university" institutions (Wananga) and is the former foundation Chair of the Council for Te Whare Wananga O Awanuiarangi. He led the successful Treaty of Waitangi Claim and settlement for Awanuiarangi. In his former position as Pro Vice Chancellor (Maori) at the University of Auckland, he was responsible for developing significant structural change within the institution while working within the Office of the then Vice Chancellor, Dr. John Hood. Notable achievements included implementing a Maori development strategy within the University which required all Deans to be responsive in their performance results for Maori and Pacific advancement; the oversight of the Proposal and winning of a National Centre of Research Excellence (Nga Pae o te Maramatanga); the initiation of the Maori and Indigenous doctoral program aimed at creating 500 Maori PhD graduates across the country in five years; the recruitment of top Maori academic scholars into the University of Auckland; the development of Kaupapa Maori as a theory of transformative praxis and which has had national and international influence. Professor Smith also served on the University of Auckland Council for three years as the Professorial representative for Academic staff.

In 2007 Professor Smith accepted a role as the Universitas 21 Distinguished Visiting Professor in Indigenous Education hosted by the University of British Columbia (within the Faculty of Education). Although the position was initially intended for two years, the role was extended for a further three years. While situated at the University of British Columbia, Professor Smith also chaired the Educational Policy Studies Department for three years. These positions allowed engagement with many Canadian universities as well as other universities across the world.

Professor Smith has made significant contributions to the political, social, economic, and cultural advancement of Maori and indigenous communities in New Zealand and around the Pacific Rim. He has worked extensively with other Native/Indigenous/First Nation's peoples across the world, including in Canada, India, US mainland (including extensive work in Hawaii and Alaska), Norway, Taiwan, Chile, Australia, as well as with selected Micronesian and Pacific nations. He is a regular contributor to national and international forums and conferences. Professor Smith has been an authoritative voice within the critical debates on *social, cultural and economic inequality* both in New Zealand and abroad, and he maintains a strong influence in the Maori/Indigenous languages revitalization movements.

Professor Smith stepped down from the administrative position of CEO/Vice Chancellor at Te Whare Wananga o Awanuiarangi in 2015 after eight years in the role. He resumed his academic research and writing career. In 2019 he was invited to take up a special Chair – Te Toi Ihorei ki Purehuroa – A "distinguished Professorial position at large" established for him at Massey University.

Professor Smith has been recognized and honored for his international contributions, receiving an Honorary doctorate (D.Litt.) from the Okanagan University College in 2005, and an Honorary doctorate (LLD) from the University of Northern British Columbia in 2013; he was elected as a Fellow of the American Education Research Association in 2014, and was awarded a Queens Honour – a CNZM in 2014. He was given the Prime Minister's Life-time Achievement Award (2017); and received the Te Ururangi National Award for Education (Matariki Awards, 2019).

Professor Smith is married to Professor Linda Tuhiwai Smith and they have one daughter and two mokopuna (grandchildren).

Therese N. Hopfenbeck is Professor of Measurement Analytics in the Melbourne Graduate School of Education, The University of Melbourne. Before starting her position in Melbourne, she was Professor in Educational Assessment and Director of the Oxford University Centre for Educational Assessment. She is a Visiting Fellow at Kellogg College, University of Oxford, elected Vice-President of *The Association for Educational Assessment-Europe* and Lead Editor of the journal *Assessment in Education, Principle, Policy and Practice*. Dr. Hopfenbeck's research agenda focuses upon bridging research on self-regulation and classroom-based assessment and making sense of international large-scale studies in education. In collaboration with Professor Nancy Perry, University of British Columbia, she is currently leading an international network of researchers disseminating classroom-based research, funded by Social Sciences and Humanities Research Council of Canada (2020–2022). She is also currently Principal Investigator for two research projects funded by IB, on critical thinking in PYP schools internationally and evaluation of education reforms in Kent, UK (2020–2022). In 2020, she led the research on Critical Thinking in the Diploma Program in Australia, England, and Norway (<https://ibo.org/research/outcomes-research/diploma-studies/critical-thinking-skills-of-dp-students/>). Dr. Hopfenbeck was Principal Investigator for the PISA (2022) study in England, Northern Ireland, and Wales, in collaboration with Pearson UK (2018–2023). She was the Research Manager of PIRLS (2016), funded by The Department of Education, UK.gov, and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019).

Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). She has advised on the implementation of formative assessment programs in India, South Africa, Norway, and the Emirates and carried out policy work for UNESCO/OECD and the Norwegian Ministry of Education Norway. Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

Nataliya Ivankova, PhD, MPH, is Professor in the School of Health Professions at the University of Alabama at Birmingham (UAB). As an applied research methodologist working at the intersection of mixed methods, qualitative, community-based, action, and translational research, she is internationally recognized for her empirical and methodological publications. She shares her research expertise through teaching mixed methods and qualitative research courses, conducting workshops and guest lectures, mentoring doctoral students and junior faculty, and serving as key personnel on funded research projects. At UAB, she directs an online graduate certificate program in *Applications of Mixed Methods Research* and oversees the design and analytical aspects of qualitative and mixed methods studies through the Center for Health Informatics for Patient Safety and Quality. She is a founding Coeditor of the *Mixed Methods Research Series* (Sage) and serves as an Associate Editor for the *Journal of Mixed Methods Research*.

Professor Jahnke is Director of Toi Kura Centre for Maori & Indigenous Education. She was the 2019 inaugural Toi o Te Wananga Fellow. Professor Jahnke holds professional qualifications in education and is cofounder and immediate past Chair of the Indigenous Peoples of the Pacific Special Interest Group of the American Education Research Association (AERA). She currently serves on the AERA Executive Committee. She was a member of the Social & Human Sciences Sub Commission of the NZ National Commission for UNESCO, the NZ Bioethics Council, the NZ Ethics Committee on Assisted Reproduction Technology, and Chair of NZ Health Research Council Ethics Committee. She is currently Cochair of the Aotearoa Research Ethics Board and a Fulbright Scholar.

Berit Karseth, PhD, is Professor at the University of Oslo, Department of Education. Karseth's main research and publications lie in the field of education policy, reforms, and curriculum studies. She has edited four books and written several journal articles and book chapters in both Norwegian and English. Her most recent publications in English include articles published in the *Journal of Education Policy*, *Scandinavian Journal of Educational Research*, *Journal of Curriculum Studies*, and *European Educational Research Journal*. Karseth was the elected dean of the Faculty of Educational Sciences at the University of Oslo 2013–2016 and is currently in the leadership team of the research group Curriculum studies, educational leadership, and governance (CLEG) at the same institution.

Dr. Kenneth Leithwood is Emeritus Professor at OISE/University of Toronto and an honorary professor at the University College London and the University of Nottingham. His research and writing is about school leadership, educational policy, and organizational change. He has published extensively on these topics. For example, his most recent books include *Leadership Development on a Large Scale: Lessons for Long-term Success* (2018, Corwin), *How School Leaders Contribute to Student Success* (2017, Springer), and *Linking Leadership to Student Learning* (2012, Jossey Bass). Professor Leithwood is the inaugural recipient of the University of Toronto's *Impact on Public Policy* award, AERA (2011) *Outstanding Leadership Researcher Award*, the 2012 *Roald F. Campbell Lifetime Achievement Award* from the University Council for Educational Administration, and the Ontario Principals' Council *Outstanding Educator of the Year* award for 2017. He is a *Fellow of the Royal Society of Canada*. A recently published bibliometric analysis found that Dr. Leithwood was the most frequently cited, highest impact educational leadership researcher in the world.¹ Research.com's 2022 Ranking of the Top 1000 Scientists in the area of Social Sciences and Humanities ranked Dr. Leithwood 70th in the world and 7th in Canada.

Xiufeng Liu is a Professor of Science Education at State University of New York, Buffalo, and a Fellow of the American Association for the Advancement of Science (AAAS). He obtained his PhD from the University of British Columbia in 1993. Before his current position, he taught high school chemistry in China, and was a tenured faculty member at St. Francis Xavier University and University of Prince Edward Island, both in Canada. From September 2020 to August 2022, he served as a program director in the Division of Research on Learning of the National Science Foundation. Dr. Liu conducts research on measurement and evaluation of STEM education and student learning of cross-cutting concepts of matter and energy. Dr. Liu is currently a Coeditor-in-chief for the journal *Disciplinary and International Science Education Research* (Springer) and an Associate Editor for the *Journal of Research in Science Teaching*, a premier journal in science education.

Margie Maaka is a Professor of Education at the University of Hawai'i at Mānoa. Her PhD is in educational psychology. She also holds professional qualifications in education from the University of Waikato and Hamilton Teachers College. She is cofounder and current Program Chair of the Indigenous Peoples of the Pacific Special Interest Group (SIG) of the American Educational Research Association (AERA). From 2017 to 2020, she served as a member of the AERA Executive Council and Chair of the SIG Executive Committee. Before that (2014–2017), Professor Maaka served as a member of the SIG Executive Committee. She has also served as a member of the Ngā Pae o te Māramatanga Center of Research Excellence International Research Advisory Panel. Her research on community-based educational renewal saw her recognized as a national scholar with the Goodlad Institute for Educational Renewal. As Cochair of the Sovereign Councils of the Hawaiian Homelands Assembly's Committee on Education, she prepared educators and educational leaders for public schools in the Hawaiian Home Lands Trust communities. Currently, Professor Maaka is committed to the preparation of indigenous educational leaders in higher education. Her research interests include community partnerships, educational psychology/indigenous educational psychology, indigenous development and advancement, educational policy, multiliteracies, and language and cognitive development.

Diane Mayer is Professor Emerita at the University of Oxford. Her research and scholarship focus on teacher education and early career teaching, examining issues associated with the policy and practice of teachers' work and teacher education.

Daniel McCaffrey is the Associate Vice President of Psychometric Analysis and Research in the Research and Measurement Science unit of the Research and Development division at ETS. Dan's research interests include the evaluation of artificial intelligence scoring of constructed responses, developing tools and methods for causal modeling, evaluating the psychometric properties of student achievement growth measures derived from annual test scores, and methods to account for measurement error in secondary data analysis. Dan received his PhD in Statistics from North Carolina State University in 1991.

Judy Parr is Professor Emerita at the University of Auckland, Faculty of Education, where she was the founding Head of the School of Curriculum and Pedagogy. A psychologist, Dr. Parr's research program is located broadly within improvement science. Her expertise is in literacy, specifically writing and its development, encompassing instructional issues like teacher knowledge and practice and the assessment of writing. Much research has been collaborative, with colleagues and practitioners within major national projects for school improvement aimed at raising achievement in literacy and, internationally, as part of funded large-scale research projects, for example in Canada and Norway. Dr. Parr has published widely in the areas of literacy, assessment, and professional learning.

Jeong-eun Rhee is a Professor of Education, Long Island University, Post, New York. Born and raised in Seoul, Korea, she earned her bachelor's degree in Educational Psychology from Ewha Women's University. In 1992, she came to the US as an international student and received an MA in Educational Psychology from West Virginia University and a PhD in Educational Policy and Leadership from the Ohio State University. As an interdisciplinary cultural researcher and educator, her recent work focuses on developing and supporting transnational, intergenerational, and decolonial feminist knowledge projects in/through antioppressive education. She recently published *Decolonial Feminist Research: Haunting, Rememory, and Mothers*, which received an honorable mention for the 2022 Qualitative Book Award of International Congress of Qualitative Inquiry.

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge, 2010), is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge, 2022), has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

Theresa Rogers is Professor of Language and Literacy Education at the University of British Columbia. Her research interests include youth arts, media and critical literacies, adolescent literature, and teacher education in literacy. Most recently she published "Youth Activism through Critical Arts, Transmedia, and Multiliteracies" in the *Oxford Research Encyclopedia*. She is author of the book, *Youth, Critical Literacies and Civic Engagement: Arts, Media and Literacy in the lives of adolescents* (Routledge) and numerous articles in scholarly journals such as *Literacy Research: Theory, Method and Practice*, *Reading Research Quarterly*, *Pedagogies*, *Language Arts*, *Children's Literature in Education* and *Journal of Literacy Research*. See: <https://ubc.academia.edu/TheresaRogers>.

Professor Chika Sehoole is a Professor of Higher Education and the Dean of the Faculty of Education at the University of Pretoria. He obtained his PhD at the University of the Witwatersrand, Johannesburg, in December 2002. In 2003/4 he was a visiting Rockefeller postdoctoral fellow at the Centre for African Studies at the University of Illinois in Urbana Champaign. In 2005/06 he was a New Century Fulbright Fellow, again, at the same university. His research interests are in the areas of higher education policy, internationalization of higher education, higher education in Africa, and teacher education. He has served in several international research projects focusing on higher education and providing expertise from the South African and African perspectives. In 2013–2017 he served as the Chairperson of the Board of the African Network for Internationalisation of Education (ANIE). He currently serves as the chairperson of the Education Deans' Forum of South Africa. He has published a singled authored book titled "Democratising higher education policy, constraints of reform in post-apartheid South Africa" by (Routledge); three edited scholarly books on higher education and more than 40 articles in journal articles, book chapters, and popular media.

Roland Sintos Coloma is a tenured Full Professor of Teacher Education at Wayne State University in Detroit, Michigan. A scholar of history, cultural studies, and education, his research addresses critical questions of race, gender, and sexuality from transnational and intersectional perspectives. His publications include *Asian Canadian Studies Reader* (2017), *Filipinos in Canada: Disturbing Invisibility* (2012), and *Postcolonial Challenges in Education* (2009). His articles have been published in top-ranked peer-reviewed journals, including *Curriculum Inquiry*, *Discourse: Studies in the Cultural Politics of Education*, *Educational Studies*, *Educational Theory*, *History of Education Quarterly*, *International Journal of Qualitative Studies in Education*, *Paedagogica Historica*, and *Race Ethnicity and Education*. He has successfully garnered over \$2 million of external funding from federal, education, and nonprofit agencies, including the US Department of Education, National Education Association, Spencer Foundation, and Schultz Family Foundation as part of the Bill & Melinda Gates Foundation's Grand Economic Challenges. Roland has served in various university leadership roles as an assistant dean, department chair, graduate coordinator, and center codirector. He was president of the American Educational Studies Association (2018–19), editor of the *Educational Studies* journal (2014–17), and program cochair of Division G (Social Context of Education) in the American Educational Research Association (AERA). He received the 2017 Distinguished Scholar Award from the AERA Research on the Education of Asian Pacific Americans SIG and the 2015 Article of the Year Award from the AERA Queer Studies and Education SIG. In 2020, he was appointed to the Governor of Michigan's statewide Asian Pacific American Affairs Commission. Born in the Philippines and raised in California, he completed his PhD in Cultural Studies in Education and Minor in African American and African Studies from The Ohio State University in 2004.

Roger Slee is the Founding Editor of *The International Journal of Inclusive Education* and *The Journal of Disability Studies in Education*. A former Deputy Director-General of Education in Queensland, Australia, he has advised governments on inclusive education policy and practice. His published books include: *The Irregular School*; *Inclusive Education Isn't Dead, It Just Smells Funny*; and *Ethics and Inclusive Education: Disability, Schooling & Justice* (with Gordon Tait). Roger was commissioned by the UNESCO to write the scoping paper for the 2020 Global Education Monitoring Report, *Inclusion and Education*. Roger also held the Chair of Inclusive Education at the Institute of Education, London, and is now the Diamond Jubilee Professor of Disability & Inclusion in the School of Sociology & Social Policy at the University of Leeds.

Ninni Wahlström is a Professor of Education at Linnæus University, Sweden. Her current research focuses on transnational and national policy discourses and their implications for national curriculum and classroom teaching from a perspective of curriculum theory and educational philosophy. Most recent publications are "School and democratic hope: the school as a space for civic literacy" in *European Educational Research Journal* (2022) and Wahlström (Ed.) *Equity, Teaching Practice and the Curriculum*, Routledge (2022).

Lei Wang is Professor and PHD advisor of the Institute of Chemical Education, the College of Chemistry in Beijing Normal University (BNU). She is also the member of Teaching Steering Committee on Basic Education of Ministry of Education of China and the director of its branch Committee on Secondary Chemistry Education, the director assistant of Faculty of Education of BNU, vice director of the Institute of Science Education of BNU, and Chairman of the Chemistry Education Committee of the Chinese Chemical Society. She is one of the chief experts in developing the *Secondary School Chemistry Curriculum Standards* of MOE. She works as the chief editor of high school chemistry textbooks (Shandong Science and Technology Press, 2004 and 2019 editions) and junior high school chemistry project-based learning textbooks (Shanxi Education Press, 2018 edition). She achieved the first prize of the National Basic Education Teaching Achievement Award, the second prize of the National Higher Education Teaching Achievement Award, and the BAOGANG Education Outstanding Teacher Award.

Everard Weber is a retired professor. He has worked in the field of education for more than 40 years. Currently he is a research associate at the University of Johannesburg (UJ) and an academic advisor in the Future Professors Programme (FPP) at UJ. He studied African Languages and History at the University of Cape Town and Comparative and International Education at Harvard University. In South Africa he has worked at Crestway High School in Cape Town, the University of the Witwatersrand, and the University of Pretoria. A recent book is *A home away from home: a community of international and South African university students*. The FPP is a government-sponsored initiative that seeks to develop the next generation of professors and academic leaders in all disciplines, across all universities in South Africa. He is in addition presently conducting fieldwork on curriculum change in South African higher education with Professor Shireen Motala and Dr. Venise Joubert at UJ. This project is grounded in the history of southern Africa and hopes to contribute to the scholarship of postcolonialism.

Ian A.G. Wilkinson is Professor in the Department of Teaching and Learning at The Ohio State University and Honorary Professor in the School of Curriculum and Pedagogy at the University of Auckland, Aotearoa/New Zealand. He has a background in educational psychology with special interests in cognition, instruction, and research methodology as they relate to the study of literacy. He served as coauthor of the influential report, *Becoming a Nation of Readers* (National Academy of Education, 1985). He was Co-Editor of *Reading Research Quarterly* from 2006 to 2012 and was inducted into the Reading Hall of Fame in 2021. His research examines the impact of classroom discussion and dialogue on students' reading comprehension and argument literacy and the implications for professional development of teachers. Recently he coauthored books include *The Most Reasonable Answer: Helping Students Build Better Arguments Together* and *Quality Talk About Text: Discussion Practices for Talking and Thinking About Text*.

David B. Yaden, Jr., PhD, is the *Jewell M. Lewis Endowed Distinguished Professor of Literacy* in the Department of Teaching, Learning and Sociocultural Studies at the University of Arizona. Prior to his present position at the University of Arizona, he held appointments at Emory University, the University of Houston, and the University of Southern California. He served as Co-Editor of the *Journal of Literacy Research*, one of the premier research journals in the field of literacy studies, and was a Principal Investigator in the federally funded Center for the Improvement of Early Reading Achievement (CIERA) where he implemented an early literacy curriculum for linguistically diverse preschoolers in inner-city Los Angeles. He also directed a statewide consortium of researchers from Arizona's major universities in the evaluation of the state's early childhood initiative to evaluate health, developmental, and educational factors contributing to school readiness. His research interests and specializations include developmental issues in early childhood education, the acquisition of literacy and biliteracy in young emergent bilingual children, family literacy, theories of reading disability, microgenetic research design, and the application of complex adaptive systems theory to growth in reading and writing.

Volume 5: Teachers' Lives, Work, and Professional Education

Diane Mayer

© 2023 Elsevier Ltd. All rights reserved.

Introduction

Teachers' lives, work, and professional education are being impacted by ever-changing policies and reform agendas across many countries. Teacher quality, usually a perception that it needs to be improved, has become the major policy focus driving these policies and reforms. A spotlight on teacher quality is fueled by concerns about declining student test scores on international assessments and perceptions that other countries (where students have better test results) must be doing schooling better. In this context, teaching and teacher education are positioned as problems, ones that can only be fixed with new policies and reform agendas, with an accompanying sense of urgency. Various government commissioned reviews and reports from transnational organizations, usually highlighting what higher achieving countries are doing to attain their higher scores, form the basis of arguments for change. Even though claims are regularly made that these new policies are evidence-based and informed by rigorous research, at their core many are ideological in nature and political in intent (Helgetun and Menter, 2020) and based on an assumption that more complex and tighter systems of accountability will improve teacher education and teaching quality.

The chapters in this Volume interrogate teachers' lives, work, and professional education within this policy context. Together the chapters span global issues, trends, and possible futures. The authors often use their own research and local country contexts as exemplars and then make links to the international knowledge base in the field, foregrounding possible implications across countries. What emerges is a picture of connections and disconnections between and among research, policy, and practice. To frame this Volume, a brief introduction provides an overview of global policy trends in teacher education and teaching, discusses the ways in which these (re)construct professionalisms, and then highlights connections and disconnections between policy and research, many of which are explored further in the chapters that follow.

Policy Contexts of Teachers' Lives, Work, and Professional Education

Globalization and the related flows of people, knowledge, and practices have resulted in policies impacting teachers' lives, work, and professional education which look remarkably similar from country to country. An almost universal catalyst for new and emerging policies, particularly in high-income countries, is an economic imperative mobilized by a view that one's own country is, or will be, less competitive because of falling test scores on international student assessments like the Program for International Student Assessment (PISA). Countries look to others who appear to be doing better and borrow policies, or components of them. Such decontextualized policy borrowing involves "a piecemeal, 'pick n mix' approach that ignores the fact that educational policies and practices exist in ecological relationships with one another and in whole ecosystems of interrelated practices" (Chung, 2016, p. 207). However, "policies are not merely being transferred across time and space... [but] their form and their effect are transformed by these journeys" (Peck and Theodore, 2015, p. 29). In addition, global corporate actors like McKinsey and Company and transnational entities like the Organization for Economic Co-operation and Development have been regarded increasingly as authoritative voices and exert significant influence in policy development and implementation (Rautalin et al., 2019; Sellar and Lingard, 2013). Thus, the policy environments impacting teachers' lives, work, and professional education have become rather complicated, with many levers operating simultaneously.

To make these policy contexts even more complicated, individual governments aim to ground their policies and reform agendas locally, seeking country-specific justifications for change, while simultaneously looking to other countries and operating within various global influences. Thus, government reviews are announced with increasing regularity, usually involving hand-picked review panels and terms of reference aligned with political agendas. Most often, these review panels are tasked to: secure the input of various stakeholders; review policies and practices in other countries, usually those deemed to be high performing; review relevant research, often dominated by the reports from transnational entities and global actors; and make a set of workable recommendations which can be directly translated into policy and reform agendas post haste, within the existing political cycle. The review final reports regularly argue there is a problem needing to be fixed and use language imbued with a sense of urgency. A few key policy levers frequently form the core of the new policy, those that governments feel they can manipulate, and be seen to be doing so, in the name of improving teacher quality. This usually involves some version of increased regulation and tightened accountability, with the mechanisms for demonstrating accountability narrowly prescribed.

The resulting policies and reforms sometimes exhibit inherent dilemmas and contradictions, creating an entangled policy space full of competing discourses and binary debates. For example, increasingly complex systems of teacher certification and regulation for initial teacher education are being imposed in many countries, impacting on the work of existing teacher preparation programs. However, at the same time, parallel policies are promoting deregulation and opening up the teacher education market to alternative providers and pathways into teaching designed to reduce the role of universities and in large measure bypass the accountability requirements imposed on university-based teacher education programs. Another competing discourse is evident in relation to the desire for a highly qualified teaching profession. On the one hand, arguments for teachers to hold master's degree qualifications are being considered, usually citing the experiences of countries reported as high performing in international assessments. However, the realities of local teacher shortages mean that governments are implementing recruitment and employment policies that result in

increasing numbers of un-, under-, and differently qualified teachers entering the profession. The consequence is policy discourses around teacher education that have become increasingly dominated by binary and sometimes simplistic debates about whether the professional education of teachers should be in schools or in universities.

(Re)constructing Professionalisms

In these environments, professionalisms are constructed and reconstructed. For example, teacher and teacher educator professionalisms have become associated with increased levels of accountability and greater use of professional standards and measures of performance that link their work with national goals and economic agendas. Such organizational professionalism (Evetts, 2013) acts as a discourse of control by incorporating rational-legal forms of authority and hierarchical structures of responsibility and decision-making and is underpinned by a low level of trust in teachers and teacher educators. Governments set out to define the work of teachers and teacher educators (in standards) and establish accountability mechanisms by which evidence of (increased) performance is to be provided. "New professionalisms" are evident; "core" professionalisms are framed by professional standards; and "branded" professionalisms are emerging linked to new and "innovative" approaches to schooling and professional education (Whitty, 2014). The consequence can be a risk averse profession exhibiting compliant professionalism (Sachs, 2016). On the other hand, occupational professionalism is framed according to collegial authority, trust, autonomy, professional judgment, and guided by codes of professional ethics (Evetts, 2013). Similarly, Sachs' (2003) notion of an activist teaching profession incorporates democratic professionalism focusing on collegial relations and collaborative work practices. These ways of thinking of professionalism are usually favored by teachers rather than governments.

Thus, a policy context with its focus on increased accountability, standards, and performance exhibits organizational or managerial professionalism—both for teachers and teacher educators. What is the role of research?

The Role of Research: Connections and Disconnections

For some time, research on teaching has been judged through a "what works" lens and its value for teachers judged according to the use or not of prescribed methodologies (Burns and Schuller, 2007). These so-called evidence-based instructional practices are often referred to in policy documents and incorporated into the accountability mechanisms emanating from these policies. The aim is to ensure that teachers are indeed using the evidence-based practices and that teacher educators are preparing beginning teachers who know and are able to demonstrate these practices, usually as part of teaching performance assessments and observations of their emerging teaching practice. More recently, arguments have emerged for rethinking professional identity around practices that are informed and improved by and through teacher and classroom research, requiring teachers to be research literate to judge the value of publicly available research for their teaching, and also to be researchers themselves in order to investigate and improve their classroom practices. Both of these approaches frame a professionalism that involves informed professional judgment and teaching decisions designed to enhance student learning. For example, in the United Kingdom, the BERA-RSA report envisages a repositioning of teacher professionalism where "a new environment of self-improving education systems teachers will need to become research literate and have opportunities for research and inquiry. This requires that schools and colleges become research-rich environments in which to work" (British Educational Research Association, 2014, p. 5). It remains to be seen whether there will be connections between this type of research and policy.

Meanwhile, teacher education research, as distinct from research on teaching, is a relatively new field of research. While it has evolved and grown over the past decades, evaluations of this body work have concluded that it is underdeveloped, small-scale, undertheorized, fragmentary, and somewhat parochial (e.g., Menter et al., 2010; Sleeter, 2014). While the small-scale studies that dominate this work do inform local teacher education practice in helpful ways, they do not produce the data sets and findings that policymakers generally appear to be seeking. The prevailing view is that this body of work has not systematically built a knowledge base for teacher education policy (Sleeter, 2014). However, the fact that teacher education programs are constantly changing and adapting means that researching such a dynamic system is difficult when using what might be considered more traditional methods of research and analysis (Cochran-Smith et al., 2014; Gray and Colucci-Gray, 2010). What is more, there are suggestions that the current body of teacher education research has been distorted and misused (Zeichner and Conklin, 2016) in policy contexts to manufacture a narrative of failure and a rationale for tighter accountability and significant reform in teacher education (e.g., Cochran-Smith et al., 2018).

Clearly, the connections and disconnections between and among research, policy, and practice are messy. The chapters in this Volume aim to illuminate the field further.

The Contribution of this Volume

The chapters explore global trends in teaching and teacher education policy exposing the connections and disconnections between policy and research, the ways in which professionalisms are (re)constructed, and the impact on teacher education and school teaching practice. Seventy-seven chapters are included, written by authors based in more than 25 countries. The authors have often foregrounded their own and others' research in specific country contexts, then positioned this within the recent international research literature, and finally raised globally relevant implications for future policy, practice, and research in/on/about/for teachers' lives, work, and professional education. The chapters are organized in the following seven sections:

- Section 1: The Policy and Political Contexts of Teachers' Work and Professional Education
- Section 2: Teachers' Lives and Work
- Section 3: Knowledge for Teaching
- Section 4: Initial Teacher Education
- Section 5: Those Who Educate Teachers: Teacher Educators
- Section 6: Ongoing Teacher Professional Learning
- Section 7: Future and Emerging Issues: Research, Policy, and Practice

In section 1, the chapters examine the policy and political contexts of teachers' lives, work, and professional education in the neo-liberalized context of the 21st century, the impact of the Global Educational Reform Movement, the high stakes accountability environments and pervasive performative policy conditions, the politics behind definitions of quality, and also the new public management and accountability policies impacting teachers' work and teacher education. Further, the impact of teacher education policy on the professionalism of both teachers and teacher educators, including those in the early childhood sector, is examined, as are the consequences for partnerships in teacher education which have been shown to be central to teacher learning. The governance of teacher education is examined highlighting the hierarchies, networks, and markets at work and also the roles and influences of non-state actors. Challenges are highlighted in supporting teachers in low-income countries to provide quality education for all learners, especially students from disadvantaged and marginalized groups.

The chapters in section 2 focus on teachers' lives and work. Beginning with early career teachers and their teaching, issues around retention, their emerging and ongoing professional identities, and their resilience are canvassed. Further, the chapters explore support and ongoing learning and development for teaching, including coaching and teacher inquiry. Issues around job satisfaction and affirming trans and queer teachers' lives are also examined.

In section 3, the chapters provide a lens into knowledge for teaching, highlighting some of the tenants of effective teaching and inclusive practices for working with diverse groups of students. A number of aspects of knowledge for teaching are examined and discussed, including epistemic practices of science, technology integration and using mobile technologies, the role of the Arts, teacher noticing, and reconciliation pedagogies.

The chapters included in section 4 contribute to our understanding of initial teacher education. First, issues of recruitment and selection are examined, and then initial teacher education approaches are probed including partnerships, community engagement, school-based experience, case methods, anti-racist teacher education, building agency and identity, and working with diverse learners. Ways by which the effectiveness of teacher education is being judged are then discussed, including teaching performance assessments and determination of its long-term effects. A group of chapters focus on the lives of teacher educators, their use of self-study for improving practice, and the ways in which they might be prepared for their teacher education role and their ongoing professional learning. Additionally, issues related to their role in ensuring equity and social justice, as well as their growth as researchers, are analyzed.

The chapters in section 5 review various approaches to ongoing professional learning for teachers including early childhood teachers. These chapters consider situated and workplace learning, the role of middle leading, lesson study, and the impact of formative assessment. The importance of coaching and of content focused professional development is argued.

The final section of this Volume includes chapters which focus on issues related to teachers' lives, work, and professional education worthy of (re)consideration into the future—the policies that impact, the research to build our collective knowledge, and the practices likely to be relevant and effective. Global and local flows and influences in education policy are analyzed, as are considerations about the impact of the pandemic and new digital learning spaces for students as well as teachers. The importance of building teachers' research capacity, their agency, their capacity to work with increasingly mobile and diverse populations, and mentoring in new spaces are all examined. Chapters highlight the promise of teacher education for advancing social justice and of comparative teacher education research in raising possible future scenarios and highlighting the power of human agency.

Together the chapters in this Volume provide a comprehensive overview of the field and highlight issues and global trends in research on, for, and about teaching and teacher education, exposing the connections and disconnections with policy, and the impact of policy on teacher and teacher educator professionalisms and practices. Collectively, they raise internationally relevant implications for future policy, practice, and research in/on/about/for teachers' lives, work, and professional education.

Order of CHAPTERS

The Policy and Political Contexts of Teachers' Work and Professional Education

4001. The Role and Influence of Non-State Actors on Teacher's Lives and Work
Moirra Hulme and Emilee Rauschenberger

4092. Teacher Education Policy and Professionalism: A Personal Review of Teacher Education Policy Research
Eline Vanassche

4012. The 'Problem' of Teachers' Work and Learning under Performative Policy Conditions
Ian Hardy

4015. Teachers' Work Amid Global Education Reform: 'The Greatest Challenge'?

Nicole Mockler and Meghan Stacey

4007. Defiant Imaginaries: From a Politics of Identity to an Ethics of Friendship in Teaching

Anne M. Phelan, Matthew Clarke, and Lily Vincent

4004. Global Politics of Quality in Education

Jaakko Kauko

4112. Revisiting Teacher Evaluation a Decade after Reforms

Joshua Bleiberg

4008. Teacher Policy Frames, Issues, and Enactment Forms

Beatrice Ávalos and Beatriz Fernandez

4003. Hierarchies, Networks, and Markets in Initial Teacher Education

Monica E. Mincu and Min Liu

4054. Can Initial Teacher Education Partnerships Maintain their Epistemological and Pedagogical Underpinnings in Light of Market-Driven Reforms? The Case of England.

Trevor Mutton, Katherine Burn, and Hazel Hagger

4098. Equity in early childhood education: Policy framing, Translation, and Enactment

Andrea Nolan and Tebeje Molla

4065. Teachers and Teaching in Low-Income Countries

Daniel Wagner and Amy Guillotte

Teachers' Lives and Work

4019. Narrative and Biography in Teacher Work Lives and Development

Geert Kelchtermans

4075. Learning to Count What Counts: Narrative Hermeneutics for Teachers and Teaching

Dennis Sumara, Sharon Friesen, Janice Doucette, Catherine Takasugi, and Jennifer Turner

4018. Researching Teacher Learning Through Self-Video

Jenni Ingram and Alf Coles

4025. Retention of Teachers from Minority Ethnic Groups in Disadvantaged Schools

Antonina Tereshchenko and Martin Mills

4027. Early Career Teachers' Work

Anna Sullivan, Bruce Johnson, and Barry Down

4011. Coaching for Professional Learning of Early Career Teachers

Pasi Sahlberg and Andrea Stringer

4087. Early Career Teaching and Resilience

Anna Lise Gordon

4085. Beginning teachers' professional identity work and its support

Gonny Schellings and Douwe Beijaard

4057. Promoting the Development of Teacher Expertise Throughout the Career

Jan van Tartwijk, Esther E. van Dijk, Johan Geertsema, Manon Kluijtmans, and Marieke van der Schaaf

4014. Teachers' Willingness and Ability to Teach to Their Best and Well: The Person in the Professional

Christopher Day

4028. Thriving the Challenges: Understanding Teacher Resilience in Chinese Hard-to-Staff Rural Schools

Qiong Li, Xiaohong Sun, and Jingtian Zhou

4033. Affirming Trans and Queer Teachers' Lives: Rethinking Teacher Professionalization and Pedagogy

Jennifer Ingrey

4082. The Role of Job Demands and Resources for Teacher Job Satisfaction: Insights from Five European countries
Anna Toropova, Stefan Johansson, Jeffrey Casely-Hayford, Lydia Kwak and Khaleda Gani-Dutt

4026. Teacher Inquiry: By Any Other Name
Anthony Clarke

Knowledge for Teaching

4035. Enacting Inclusive Pedagogy in Teacher Education: Creating a Learning Space for Teachers to Develop their Professional Identity
Hafðís Guðjónsdóttir and Edda Óskarsdóttir

4036. Learning to Teach Epistemic Practices of Science in Secondary Schools
Sibel Erduran and Liam Guilfoyle

4037. Teacher Skills and Knowledge for Technology Integration
Leming Liang and Nancy Law

4020. The Relationship Between Knowledge Exchange and Teachers' Use of Mobile Technologies in the Mathematics Classroom
Kinga Petrovai, Gabriel Stylianides, and Niall Winters

4010. Teaching is Influenced by the Teacher
Janet Clinton, Ruth Aston, and Georgia Kate Dawson

4040. Teacher Education and the Arts: Challenges, Tensions, and Opportunities
Robyn Ann Ewing

4041. Emotion and Reconciliation Pedagogies
Michalinos Zembylas

4093. Teacher education and the development of teacher noticing
Johannes König

Initial Teacher Education

4083. Teacher Recruitment and Selection
Robert Klassen, Jade Rushby, and Tracy Durksen

4090. Professional agency of student teachers in initial teacher education
Äli Leijen

4038. Teacher Identity: Crossing the Technical-Rationalist and Affective Divide
Sue Ellis and Navan Govender

4109. Teacher Education for Diverse Learners
Katrina Liu and Richard Miller

4049. Educating the Teaching Profession
Solvi Lillejord

4045. International Perspectives on Community-Engaged Teacher Education
Rocío García-Carrión and Eugenia Allotey

4002. University-School Partnerships in Initial Teacher Education
Maureen Robinson and Jennifer Feldman

4116. Inside looking out: A third space perspective on preservice teachers' practice experiences
Viviana Daza

4051. Case Methods in Teacher Education
Misty Sato

4056. Contemporary Challenges and Approaches in Anti-racist Teacher Education
Verna St. Denis, Jenn K. Bergen, and Sharissa Unger Hanthe

4047. Teaching Performance Assessments

Larissa McLean-Davies

4021. Determining Long-Term Effects of Teacher Education

REPRINT

Those Who Educate Teachers: Teacher Educators

4016. A Lifetime of Experience: An International Study on the Lives of Teacher Educators

Clare Kosnik, Pooja Dharamshi, and Lydia Menna

4053. Self-Study of Teacher Education Practices: The Complex Challenges of Learning from Experience

Tom Russell and Rodrigo Fuentealba Jara

4050. Professional Development or Professional Learning: Developing Teacher Educators' Professional Expertise

Gerry Czerniawski

4097. Equity- and Justice-minded Teacher Educators

Jamy Stillman

4058. Improving Teacher Education through the Self-Study of Practice

Julian Kitchen

4111. Preparation of novice teacher educators for critical, justice-oriented teacher education

Hilary Conklin

4089. Teacher Educators' Professional Growth as Researchers

Leah Shagrir

Ongoing Teacher Professional Learning

4061. Questioning the Consensus on Effective Professional Development

Jenny Gore, Sally Patfield, and Leanne Fray

4062. Situating Teacher Learning in the Mathematics Classroom and Everyday Practice

Janette Bobis and Kristen Tripet

4066. Middle Leading as a Practice for Enabling Professional Learning

Karin Rönnerman and Veronica Sülau

4031. Developing Teachers: A Necessary Condition for Quality Retention

Qing Gu

4068. Contemporary Approaches to Teacher Professional Development

Karen Koellner, Hilda Borko, Jennifer Jacobs, and Nanette Seago

4069. Teacher Learning as Workplace Learning

Jeroen Imants and Klaas van Veen

4118. Lesson Study: A Practice for Teachers' Training and Professional Development at any educational level

Gabriel Hervas and José Luis Medina

4063. Examining Conceptual Frameworks for Understanding Teacher Learning in the Domain of Formative Assessment

Brent Duckor and Carrie Holmberg

4064. Conceptualizing Professional Development with and for a Diverse and Globally Mobile Early Childhood Education Workforce

Joce Nuttall, Susan Grieshaber, Sirene Lim, and Eunju Yun

Future and Emerging Issues: Research, Policy, and Practice

4094. The Global and the Local: Idea Flows, Contexts, and the Influencing of Education Policy in the 21st Century

Jo Helgetun

4091. Teachers' Research Capacity and Initial Teacher Education Policy

Clare Brooks

4070. Studying Teachers' Work and Lives: Insights from research before and during the COVID-19 pandemic
Maria Assunção Flores
4101. Teachers' Work in the Context of COVID-19
Lora Bartlett, Judith Warren Little, Alisun Thompson, Lina Darwich, and Riley Collins
4034. Reclaiming the Artistry of Teaching
Gert Biesta
4084. Tackling teacher shortages: doing the right thing at the right time and with the right evidence
Beng Huat See, Stephen Gorard, and Rebecca Morris
4048. Educating a World on the Move: Rethinking Teacher Preparation in the Context of Mass Global Migration and Increasingly Diverse Classrooms
A. Lin Goodwin, Seung Eun McDevitt, Crystal Chen Lee, and Sibel Akin-Sabuncu
4044. Research for Socially Progressive Teacher Education Programs
Aileen Kennedy
4043. The contribution of initial teacher education to social justice
Fiona Ell
4086. Online Teaching and Learning Practices in Teacher Education: Past, Present, and Future
Carmen Carrillo and Maria Assunção Flores

Introduction

A growing number of non-state actors work in education, shaping the lives of teachers and the policies related to their work. Non-state actors are individual and collective actors that are unelected and independent of government and range from the well-known supranational bodies of the World Bank, the Organization for Economic Co-operation and Development (OECD) and the United Nations Educational, Scientific and Cultural Organization (UNESCO), to national and international non-profit organizations and foundations, to private philanthropists and for-profit edu-businesses. The involvement of such actors at varying levels of the educational landscape has rapidly expanded in the past two decades, both in developed and developing countries alike. This development has fueled widespread debates about the purpose of education, data use in policy deliberation, the responsibilities of national and sub-national government, and the role of the private sector.

The article is organized in two main sections. The first section outlines the key data initiatives and policy tools used to leverage system reform by influential supranational agencies. Principal among these are the OECD's Program for International Student Assessment (PISA), the Teaching and Learning International Survey (TALIS), and the World Bank's SABER initiative (Systems Approach for Better Education Results), including SABER-Teachers. The second section discusses the rise of the Global Education Industry (GEI) with its mix of non-profit and for-profit non-state actors working in dense evolving networks with the support of a variety of corporations, foundations, and private philanthropists. Particular attention is directed at how non-state actors frame the problem of teacher quality and propose market-based solutions using the examples of low cost private schools and fast track teacher preparation programs. The article concludes with consideration of the impact of supranational bodies and the Global Education Industry on teachers' work and their workplaces.

Supranational organizations

After two world wars and the formal end of European colonization, countries old and new focused on education as part of nation building while looking to international cooperation to provide support and stability. In this context, a number of supra-national organizations were established and became central to the development of a global education space in the latter half of the twentieth century. The UNESCO, OECD and the World Bank are among the most influential. These organizations provide financial, regulatory, and agenda-setting functions and play a key role in framing and communicating policy ideas influencing the selection, development, evaluation and compensation of teachers. Increasingly, they serve as knowledge producers and mobilizers—roles that are entrenching and expanding their legitimacy and power (Zapp, 2020). Their work is reshaping the work and lives of teachers across the world as school systems are accorded value in terms of measurable performance outcomes and their future contribution to national economic growth. Through this process, non-governmental actors have gained greater control of how the good teacher is classified and framed.

UNESCO was founded in 1945 by 37 countries as a human rights organization to promote international cooperation on issues related to education, science and cultural causes. Although initially primarily Western-funded and European-focused, the work of UNESCO broadened geographically and shifted to global problems of poverty, illiteracy, and underdevelopment, including education, as more developing nations joined from the 1950s onwards. UNESCO brought a global focus to education through its collaborative work setting up the World Conferences on Education for All (EFA) in Jomtien, Thailand in 1990 and Dakar, Senegal in 2000. Through this work, in collaboration with the World Bank and four other United Nations agencies, UNESCO initiated the EFA movement bringing together government and non-state actors around six goals, which include ensuring free universal primary education for both all (Verger and Novelli, 2012). With global pressure on national governments to expand their education system to meet ambitious goals, the funding and participation of private, non-state actors with a variety of interests became increasingly welcomed and normalized. From 2001, using the EFA framework and Sustainable Development Goals (SDGs), the strategic activities of the OECD and World Bank increasingly moved from ensuring access to ensuring quality (OECD, 2005, 2015).

Through its data gathering and knowledge mobilization activities, the OECD is now a central actor directing global education discourse. Sellar and Lingard (2014, p. 932) argue that the OECD exerts “infrastructural governance”, referring to the international networks and systems it has built to enable its vast data collection activities, and “epistemological governance”, referring to the OECD’s ability to influence leading education actors across contexts and levels. Established in 1961 to stimulate economic growth and world trade, the OECD originally had 19 members—16 European countries and the US, Canada, and Turkey. By 2020, the OECD had 37 member governments and offered its analytical expertise to over 100 developing and emerging market economies. In contrast to UNESCO’s emphasis on “global citizenship” and cultural interdependency, the OECD conceptualizes “global competence” narrowly as an economic necessity (Vaccari and Gardinier, 2019, p. 68). From 2002, the OECD has taken a more active role in education with a designated Education Directorate.

Perhaps the most utilized global indicator of educational quality is the OECD’s Program for International Student Assessment (PISA). Launched in 2000, PISA soon became a proxy measure for education quality aligned with human or knowledge capital. Conducted every three years, PISA tests assess the knowledge and skills of 15-year-olds in reading, mathematics and science. PISA is not simply curriculum-based like the International Association for the Evaluation of Educational Achievement’s (IEA) Trends in Mathematics and Science Study (TIMSS), and Progress in International Reading Literacy Study (PIRLS). In contrast, PISA claims to measure how well students are equipped to meet future challenges. Optional parent and teacher questionnaires were added in 2006 and 2015 respectively, with low take up rates. Seventy-nine countries participated in PISA 2018. In addition to the main tests, the OECD has extended its reach by offering national, subnational, and school-level educational performance data through *PISA for Schools* and professional learning through the *PISA4U* online platform (Lewis et al., 2016; Lewis, 2020).

The agendas of the OECD, UNESCO and the World Bank converge in the promotion of PISA in international development. There is a shared commitment to building a global testing regime, although it should be acknowledged that the evidence used to link international test scores and economic growth over time is inconclusive (Kamens, 2015). In 2013, the PISA for Development (PISA-D) initiative—an adaptation of the existing PISA test specifically designed for low and middle-income nations—was piloted in nine countries. The OECD plans to have 170 countries participating in PISA by 2030, with the involvement of low and middle-income nations in the regular PISA cycle from 2021 onwards. While the expansion of PISA to low-income nations is espoused as demand-led, evidence from interviews with in-country actors suggests this is not always the case. For example, Auld et al. (2019) argue that the introduction of PISA-D in Cambodia in 2016 was not locally owned, but by-passed both earlier aid coordination mechanisms and the concerns of the Cambodian government that National Assessment plans would be undermined. Efforts to align national and regional assessments with PISA run the risk of disenfranchizing educators if national systems for student assessment and school inspections are considered subordinate to the interests of international policy harmonization. For example, in Ecuador and Paraguay, Addey (2017) argues that greater attention was given to aligning national assessment procedures with PISA and PISA-D than to the development of a testing system that was country-specific and policy relevant. Moreover, it is debatable whether building technical capacity for testing can be equated with building educator capacity to enhance learning.

Politicians, civil servants and journalists pay close attention to national positions within PISA performance rankings. Changes in national standing are amplified by the media in a triennial international spectacle that creates winners and losers. The education systems of high achieving countries such as Finland, South Korea and Shanghai-China attract attention for the purposes of lesson drawing (OECD, 2018). The feasibility of transference to diverse geo-political contexts is less widely discussed, despite Finnish exposition of the historical and cultural conditions that contribute over time to higher ranking (Sahlberg, 2011). The “PISA shock” resulting from lowering of a country’s comparative position evokes debates in Parliament and among teachers’ and school leaders’ unions, as was the case in Germany, Denmark, Poland, and Ireland (Michel, 2017).

Participation in high profile international assessments has implications for teachers’ practice. The high stakes attached to PISA outcomes arguably diminishes local autonomy and school control over the curriculum and textbooks, and increases pressure on educators to teach to the test to the detriment of wider curricular goals. Some governments, for example Wales, have developed a suite of PISA professional development materials for use by primary and secondary schools, local authorities/school districts and regional consortia to align local practice more closely with PISA assessments (Welsh Government, 2019). Others have produced videos to inspire the national sample of students, for example *PISA 2012—Representing Your Country* produced by the Scottish Department of Education and anchored by the Scottish National Party Minister for Education (Lingard and Sellar, 2014).

PISA outcomes have consequences for teacher policies. PISA results are a political tool deployed selectively by national policy makers as a warrant to support a desired direction of change. For example, poor PISA outcomes were used as a resource to support the case for the Gonski teaching reforms in Australia, and comprehensive reviews of national systems for teacher education in Ireland and Wales (Gonski et al., 2018; Sahlberg et al., 2014; Furlong, 2015). PISA outcomes are also deployed as a weapon by Ministers to challenge and exert pressure on political opponents within electoral cycles. For example, in the UK, PISA 2012 outcomes in Labor-majority Wales were used by the then Conservative Education Secretary in England, Michael Gove, to attack Wales as “a country going backward” that was paying the price for abandoning performance tables and external accountability (Adams, 2013).

Media amplification of PISA outcomes seldom features scientific debate. The use of PISA outcomes within policy debates has been accompanied by calls for greater transparency and acknowledgment of limitations and biases. For example, recommendations based on analysis of PISA data routinely draw on correlational rather than causal relationships (Hopman et al., 2009; Araujo et al., 2017). The analysis uses cross-sectional rather than longitudinal assessment data. The representativeness of national samples is affected if countries exclude young people with special needs and newly arrived students. Returns are influenced by school and student threshold response rates, which must reach 80%. Interpretation of results requires consideration of the long-term development trends of participating countries. A number of studies have challenged the validity of standardized testing and rank ordering of

countries, drawing attention to cultural differences between nations, a failure to consider how teacher quality is defined, or the range of student outcomes that might be valued (personal, social and academic) including the wider goals of education.

Nevertheless, PISA outcomes are increasingly used as a proxy measure for teacher quality and the quality of teacher education, despite the limitations of equating student test scores with the efficacy of teacher preparation and continuing development (Auld and Morris, 2016; Baird et al., 2016). In the past two decades, universities in developed countries have grappled with reforms, both internally developed and externally mandated reforms, to improve their teacher preparation programmes (Cochran-Smith et al., 2018; Sleeter, 2014; Mayer et al., 2015; Rauschenberger et al., 2017). Concern with Initial Teacher Education (ITE) and teacher quality along with global push for measurable indicators of performance has led to a search for ways to measure ITE outcomes quantitatively. In the US, six state governments have used new teachers' value-added measures (VAM), based on their pupils' achievement on standardized tests, to assess the effectiveness of institutions' teacher graduates in the classroom (Coggsall et al., 2012). Interestingly, a number of these assessments have shown overall greater variation among graduates of the same program and relatively little variation in graduates' effectiveness across different ITE programmes (Koedel et al., 2015). Nevertheless, the push to measure quantitatively the quality of ITE programs persists and provides the opportunity for non-state actors to demonstrate how their methods might produce teachers who garner higher pupil test scores.

In 2008, the OECD extended its education data gathering by launching the Teaching and Learning International Survey (TALIS) in 24 countries (OECD, 2009). A second wave in 2013 included 34 countries and established a TALIS-PISA link. By 2018, the TALIS survey covered about 260,000 teachers in 15,000 schools across 48 countries. The survey asks lower-secondary teachers and school leaders about working conditions and learning environments, and offers comparative analysis to support national policymaking (OECD, 2020). Analysis from TALIS informs a series of thematic reports and working papers, and a range of advisory insight and lesson reports intended to guide in-country deliberation. A *Teacher's Guide* was introduced following TALIS 2013. TALIS findings are deployed as a powerful warrant framing deliberation on teacher policy. The European Commission's *Education and Training Monitor*, an annual evaluation of education and training system across Europe, draws heavily on TALIS findings. In charting the Europeanization of education policy, Grek (2014) has noted how the European Commission found in the OECD, "not only a great resource of data to govern (which it did not have before) but also a player who would be pushing the Commission's own policy agenda forward" (p. 267). Like PISA, TALIS findings are used to establish and repeat an evidence-informed and outwardly pragmatic agenda for change.

However, critical commentators identify a normative bias toward flexibilization of employment relations in TALIS (Sorenson and Roberston, 2018; Berkovich and Benoliel, 2018). Flexibilization entails changing work practices wherein employers may no longer use internal labor markets or guarantee long-term job security, and may incentivize, re-assign and redeploy employees more easily. By focusing on teacher performance, underpinned by a utilitarian, cognitive-economic model of education, critics suggest the TALIS survey carries an individualist and anti-collectivist agenda as it migrates across contexts. TALIS findings have been used to support performance management in teaching, preparing the way for the introduction of performance-pay by reform-minded Ministers and private school chains (Froese-Germain, 2010).

Labor market flexibilization also underpins the World Bank's promotion of incentive policies that link pay or tenure to performance (World Bank, 2013). The World Bank is the foremost proponent of a neoliberal education reform agenda. While the OECD was initially oriented toward advanced economies, the World Bank was first set up in 1944 to provide loans to developing countries that could not secure such finances otherwise. Based in Washington, D.C. and often working closely with the International Monetary Fund, efficiency gains are sought using neoliberal principles of deregulation, competitiveness, and privatization. Urgent reform is justified in terms of a race to maintain economic competitiveness in the developed economies of America, Australia and Europe, and to foster economic growth in low and middle-income countries. The World Bank provides loans for educational projects, as well as technical assistance and educational research at multiple levels.

By the 1980s, the Bank had come under intense criticism for its structural adjustment policies that required developing countries to enact privatization and free-market policies in its public sectors, including education, as a condition of their loan. In addition to undermining national sovereignty, these policies caused many governments to cut funding to education, leading to greater educational disparities and paving the way for private non-state actors to fill that vacuum in Africa, Asia, and Latin America. The World Bank, the Inter-American Development Bank, the Millennium Challenge Corporation and the Asia Development Bank all use PISA results in project appraisal. International assessment results are used to provide empirical evidence of the relative effectiveness and efficiency of targeted investment. For example, PISA results were used to evaluate projects supported by the Millennium Challenge Corporation in Georgia and the World Bank in Bulgaria, the Republic of Moldova and Kyrgyzstan (Lockheed et al., 2015).

The World Bank's SABER initiative (Systems Approach for Better Education Results), established in 2011, reflects its ambition to operate as a Knowledge Bank. The SABER-Teachers initiative collects, analyses, synthesizes and disseminates information on teacher policies around the world to support evidence-informed policymaking. SABER reports are used extensively by UNESCO's Global Education Monitoring Report and EFA Teacher Task Force, the Education Commission, PISA for Development (PISA-D), the World Food Program, US AID, and Results for Development (Klees et al., 2020). Teachers and workforce development are among the thirteen education topics benchmarked by SABER. The World Bank Group has consistently argued that "most teacher training is ineffective" and in-service training too often leads to "changes in teacher knowledge but not practice" (WB, 2018: 131–132). The SABER-Teachers initiative forms part of an advisory bloc that also includes the World Bank's Systems Approach for Better Education Results Engaging the Private Sector (SABER-EPS). Policy advocacy has centered on attracting the best (highly qualified) entrants, using compensation strategies to incentivize teacher performance e.g., performance related pay and flexible employment relations within autonomous self-managing schools (WB, 2015, 2018). In collaboration with UNESCO, the World Bank also provides

Edstats, an online portal that contains country-level data on a range of education topics including access, completion rates, and expenditures. Through these knowledge-related initiatives, along with its lending practices, the World Bank is able to shape countries' education-related policies toward its economic priorities.

While there are differences in historic orientation and mission between the supranational agencies described above, the use of opinion formation and coordinating activities has accelerated convergence in policy processes. System improvement is promoted through a policy mix of high stakes external accountability, public-private partnerships, and teacher incentives (Bruns et al., 2011). The following section outlines the growth of private providers in the delivery of educational services and the implications of this for teachers' lives and work.

The global education industry

From the 1980s onward, the growing liberalization of trade worldwide resulted in the partial conversion of education to a tradeable service. Public/state education sectors are now increasingly open to non-state actors providing educational goods and services, leading to the development of what has been termed the Global Education Industry (GEI) (Tooley, 2001). Verger et al. (2016) define the GEI as, "an increasingly globalized economic sector in which a broad range of educational services and goods are produced, exchanged and consumed, often on a for-profit basis" (p. 4). At the center of the field are "edu-businesses" (Ball, 2012). Verger et al. (2016, p. 12) categorized five types of edu-business, outlined below, to which corporate-funded private organizations and individual education entrepreneurs can be added.

- Chains of private schools (e.g., GEMS, ARK, Bridge International Academies, and the Omega schools). Several of these are low-fee private schools, such as Bridge International Academies, that operate in economically depressed areas and aim to generate a profit for investors through charging students' families "affordable" fees while reducing the running costs of schools. To cut costs, low-fee private schools rely on the use of technology, centralization of operations, employment of low-wage, uncertified teachers, and/or minimizing infrastructure/building costs. (See section "**Private school chains and teachers' work**" below)
- Large education corporations and conglomerates (e.g., Pearson) that offer a broad range of educational products and services. Included in this category are software companies (e.g., Microsoft, Intel, Cisco, Hewlett Packard and Blackboard) that provide technological infrastructure for digital learning and data tracking.
- Consultancy firms (e.g., PriceWaterhouseCoopers, McKinsey, and Boston Consulting Group) and individual consultants that apply business principles to education. Whether working with national governments, NGOs, or alone, educational management consultants and large elite consultancy firms generate data and analysis of educational problems and solutions rooted in economic perspectives. In reports co-authored by Michael Barber, McKinsey has been particularly influential in shaping debates on teachers and teacher education. McKinsey's reports have reinforced the centrality of the teacher in improving pupil outcomes, consistently emphasizing the importance of recruiting and training highly talented individuals into teaching and fostering leadership within and across the school system (Barber and Mourshed, 2007; Barber et al., 2010). Their reports have called on education systems to develop globally benchmarked standards, data transparency, and effective central management but operational autonomy for schools while maintaining a focus on addressing equity and community (Barber and Mourshed, 2009). While their reports shape education discourses and agendas, consultants also help to build public-private partnerships that create new links between educational stakeholders and private sector actors, contributing to the evolution of translational networks advocating neoliberal global education reform.
- Philanthropic foundations (e.g., Bill and Melinda Gates Foundation, the William and Flora Hewlett Foundation, Eli and Edythe Broad Foundation, the Walton Family Foundation, the George Soros's Open Society Foundation) which are separate from and autonomous of any corporate entity but are more or less aligned with the business vision and strategy of their founders and donors. These organizations fund a variety of initiatives including NGOs and charter/academy schools as well as leadership programs that recruit and train teachers (e.g., Teach For All) and school system leaders (e.g., Broad Superintendents Academy). Philanthropic foundations also fund research into proposed education reforms such as teacher accountability measures and performance-related pay. (See section "**Philanthropic foundations and teacher education**" below).
- Advocacy networks, including policy networks, that coalesce and evolve among a wide range of non-state actors as their interests converge around support for particular educational reforms such as school choice, low-fee private schools, and fast-track teacher training (e.g., Teach For All). While advocacy networks working at the transnational level include civil society coalitions such as the influential Global Campaign for Education and the Inter-Agency Network (Verger and Novelli, 2012; Macpherson, 2016), networks driven by the interests of private, non-state actors tend to be more exclusive in membership and less transparent in their activities. The influence of these networks is increasing in policy-making and service delivery.

Closely related to these categories are corporate-funded private organizations such as business-linked philanthropies, think tanks, lobbying firms, and private policy institutes. Through activities such as research, knowledge mobilization, lobbying, grassroots organizing, and networking, these private organizations are influential in leveraging corporate influence at various policy levels (Fontdevila and Verger, 2019; Fontdevila et al., 2019). The New Schools Venture Fund is an example of a highly influence private organization in the US that funnels private and corporate money into education start-ups (Zeichner and Pena-Sandoval, 2015).

In addition, the GEI is populated with individual policy entrepreneurs who advocate for particular educational ideas and act as boundary spanners who connect and work across organizations and sectors to promote education innovations (e.g., James Tooley,

Michael Barber, and Wendy Kopp). All these types of organizations and individuals work through transnational networks and interact with development agencies, NGOs, and governments at various levels (Ball and Olmedo, 2011; Robertson and Verger, 2012; Macpherson, 2016). It is common for actors within this field to have held various roles in different edu-businesses as well as in think tanks, academia, and/or government.

The diverse types of non-state actors described above are linked in the GEI through dense and complex inter-locking networks (Ball, 2012; Olmedo, 2014; Verger et al., 2016). These transnational networks are formed and sustained more or less formally through various national, regional, and global events and conferences such as the Qatar's Foundation World Innovation Summit Education (WISE), the OECD's Global Education Industry Summit, International Summit on the Teaching Profession co-hosted by the OECD and Education International, and the World Economic Forum's Davos Conference (Ball and Junemann, 2012). These events provide the opportunity for business leaders, investors, policy-makers and policy entrepreneurs among others to meet up, discuss, and socialize, furthering the knowledge diffusion and commitments that so often fuels policy transfer (Stone et al., 2020). Consequently, edu-preneurs and policy advocates are able to work at local, region, and national levels through the GEI to pitch their business and policy ideas to a broader audience of corporate, government, and philanthropic elites (Ball and Olmedo, 2011; Olmedo, 2013; Rönnberg, 2017; Giridharadas, 2019). Their involvement in education promotes quasi-markets in the sector, the standardization of teachers' work and pupils' achievements, and a loosening of the regulations that typically govern public schooling.

Development agencies, philanthropists, and blue-chip companies are closely tied to the growth of the GEI through their funding of new educational ventures. This "new" philanthropy or aid—also referred to as "venture philanthropy" (Olmedo, 2018) and "philanthropy-capitalism" (Bishop and Green, 2008)—advocates market-based solutions and incentives to providing public services, often for a profit, and is an approach that "intentionally blurs the line between business, enterprise, development and the public good" (Ball and Olmedo, 2011, p. 84). This mode of financing mirrors venture capitalism as investors opt to fund mainly small, early-stage, emerging organizations that are deemed to have high impact and/or profit potential that is scalable. Unlike earlier types of educational philanthropy, venture philanthropy bestows upon donors, or "investors", an influential role in educational policy and practice as they can closely control, monitor, and evaluate the use and impact of their investment to advance their strategic objectives. As a result, Saltman (2011) highlights that venture philanthropy has the "strategic aim of 'leveraging' private money to influence public schooling" and "is contributing to both the privatization of public schooling as well as the transformation of public schooling on the model of corporate culture" (p. 3). New philanthropy financing flows toward market-based educational reforms including vouchers, privately managed public schools, low-fee private school chains, and new types of teacher training.

In the next section, the effects of these developments on teachers are explored through two illustrative examples: private school chains and fast track teacher training.

Private school chains and teachers' work

There has been an explosive rise of private schools for mostly poor but also some middle class families (e.g., Weller, 2017) in developing countries—a development that has paralleled the expansion of charter, academy, and free schools in the US and UK. Low-fee private schools, which are independently owned, managed, and financed and charge what they deem affordable fees for the economically depressed communities in which they are located, have drawn criticism for their reliance on learning technologies, large class sizes, and centralized, standardized operations (including instruction and curriculum). Low-fee private schools are prevalent in sub-Saharan Africa (e.g., Malawi, Nigeria, Kenya and Ghana), South Asia (e.g., India and Pakistan) and Latin America (e.g., Peru and Central American countries). As many low-fee private school are not regulated, and hence not included in administrative records, the size of this sector is difficult to measure. Their impact on teachers has been twofold. First, teachers have seen their work change as chains of low-fee private schools seek to reduce cost by setting curriculum, learning tasks, and assessments centrally, while also utilizing online instruction to "individualize" learning without the need for a teacher. Second, many low-fee private schools (as well as charter/academy chains) hire unqualified and/or inexperienced teachers, opting instead to provide in-house training to orient teachers to their particular learning priorities and teaching practices.

One of the fastest growing chains of low-fee private schools is Bridge International Academies (BIA), a multinational chain founded in 2007 by three American entrepreneurs. Their Academy-in-a-Box model was designed to be replicable and scalable, and is based on a highly controlled learning environment with a large target class size (Kirchgasler, 2016). As Riep (2019) explains, "pre-programmed curriculum is developed by BIA at corporate headquarters abroad and then sent electronically to each school site using web-enabled smartphones that transfer curriculum to tablet e-readers, which is then read out verbatim, word-for-word, to students by unqualified staff referred to as 'Learning Facilitators'" (p. 7). The first BIA school opened in the informal settlement of Mukuru, an area of extreme poverty in Nairobi, Kenya.

BIA's initial funding came from investors in 2008 and 2009, which included Deutsche Bank America's Foundation, Gray Ghost Ventures, the Kellogg Foundation, and the Omidyar Network (established by billionaire eBay founder Pierre Omidyar) (Reip, 2017). In the following years, BIA has attracted private equity investments from a number of entrepreneurs in the educational technology sector including Bill Gates, Facebook founder Mark Zuckerberg, and Pearson PLC. The national governments of the US and UK have invested in the chain, raising concerns about the investment of public funds in for-profit education abroad. As the international list of funders grew, BIA expanded to other sub-Saharan countries as well as India. By 2016, Riep and Machacek (2016) estimate that BIA operated in "more than 520 for-profit schools throughout Kenya, Uganda, Liberia, Nigeria, and India, serving approximately 120,000 pupils" (p. 5). Despite its growth, the chain has yet to make a profit as its model suggests that it needs

to reach between 250,000 and 500,000 students to do so (Kwauk and Robinson, 2016). Private school chains, like BIA, are shaping teachers' work in the countries where they operate by hiring under- or unqualified teachers, paying them low wages, closely controlling and monitoring their work, and offering few, if any, employee protections.

Philanthropic foundations and teacher education

In addition to the employment and working conditions of teachers, the Global Education Industry increasingly contributes to the recruitment, selection and preparation of new teachers. While NGO involvement in teacher training is common in developing countries, the emergence of fast-track teacher training routes is on the rise. Among the most controversial and well established among these is Teach For America (TFA), founded in the US in 1990 by Wendy Kopp. The fast-track program aggressively recruits high-achieving graduates of elite universities to train for a summer and then serve as teachers in under-resourced schools for two years. The high-profile model has been replicated by non-state actors in more than 53 countries worldwide since 2007 with the help of the global Teach For All organization (Crawford-Garrett and Thomas, 2018; Thomas et al., 2020). Worldwide, the programs are funded by a mix of philanthropic foundations, corporations, and governments, claims to be helping raise pupil achievement in the short term while building a pipeline of leaders to education systems worldwide. Various national TFA models collaborate with university-based ITE providers in a relationship that has often been contentious due to the model's elite positioning and its overtly neoliberal view of teaching and learning (Meyers et al., 2014).

Backed by the World Bank and OECD, Teach For All's national affiliate programs also affect wider perceptions of teaching by portraying it as a temporary service commitment through which graduates can help "other" children in communities unlike their own while positioning themselves for success outside the classroom (Ahmann, 2015; Ellis et al., 2016). The network of Teach For All programs has also supported the expansion in privately run schools, whether for-profit chains in India or publicly-funded charter and academy school in the US and UK, as the program frequently places its recruits in such schools (Kretchmar et al., 2014). Furthermore, Teach For All programs promote the deregulation of ITE in the contexts in which they operate (Kretchmar et al., 2018) while creating a cadre of neo-liberal educational leaders who go on to lead privately-supported schools, establish new edu-business, and work in philanthropy or policy (Trujillo et al., 2017).

In the US, TFA and its alumni have recently helped spur the creation of a new generation of alternative teacher preparation organizations (Cochran-Smith et al., 2020). Whether tied to specific charter school chains, including so-called graduate schools of education (i.e., Match Teacher Residency, High Tech High Teacher Center) or stand-alone institutes (i.e., Relay GSE, Sposato GSE), these new private teacher training organizations are state-authorized to provide teacher certification and/or master's degrees and are funded by a mix of private and public funds (Zeichner and Pena-Sandoval, 2015; Mungal, 2016, 2019). Their approach to training is exclusively practice-centered and school-based with graduation often tied to the ability to raise pupil test scores. Relay GSE, the most high profile of the group of new providers, was created by three charter school chains: Knowledge Is Power Program, Achievement First, and Uncommon Schools. As Stützlein and West (2014) report, these charter school chains are "closely tied to major business interests, including foundations and investors such as J.P. Morgan, the Bill & Melinda Gates Foundation, and Credit Suisse, each of whom have financially supported Relay" (p. 3). In addition, Relay GSE has close links with Teach For America, who now annually funnels hundreds of its teachers to Relay, and the New Schools Venture Fund, a venture philanthropy organization that aggressively lobbies for, funds, and trains individuals to set up new entrepreneurial teacher preparation programs (Zeichner and Pena-Sandoval, 2015).

The development of standalone GSE closely tied to charter schools in the US inspired a similar effort in the UK, with the establishment of the Institute for Teaching. Officially launched in 2017 with funding from government, hedge fund managers and philanthropic foundations, the Institute for Teaching was set up to be a "teacher-led" (rather than academic-led) and "practice-orientated" professional preparation program for new and in-service teachers (Ellis et al., 2018). Although the Institute merged in 2018 with Ambition School Leadership to form the Ambition Institute, in its new form it still represents an alternative to university-based teacher education. Both trends—tied to the Teach For All network—illustrate the interconnectedness of non-actors and their international networks. These networks advocate for deregulation, market-based solutions, and new conceptions of teacher education that primarily rely on a narrow view of pedagogy, an "impoverished" conception of experience (Ellis, 2010) and deficit thinking toward children in economically-depressed communities (Pitzer, 2014) while equating higher pupil standardized test scores with providing a high-quality education.

In addition to funding alternatives to university-based teacher education, private and corporate philanthropy has changed the educational landscape and teachers' work in a myriad of other ways. Foundation funding has promoted school choice and led to the establishment of charter schools, academies, and low-fee private schools in high-poverty communities across the US, UK and developing world respectively. Many of these schools have promoted a variant of the "no-excuses" ethos, narrow curriculum, and teaching by unqualified and/or inexperienced teachers. Philanthropists and private foundations have also provided start-up funding to edu-businesses, which shape the technology, assessments, and training teachers increasingly rely on.

Finally, foundations have a clear impact on teachers through shaping the research that informs the profession and policy debates pertaining to it. For example, starting in 2009, the Gates Foundation turned its attention to the issue of teacher quality and funded two large projects—the Measures of Effective Teaching (MET) study and Intensive Partnerships for Effective Teaching initiative. The MET project (2009–2012) involved multiple independent research teams and nearly 3000 teachers from seven school districts, and sought to find a reliable and replicable measure of teachers' effectiveness. Ultimately, researchers on the study declared teacher effectiveness measures should combine three types of measures: classroom observations, student surveys, and student achievement gains

(Kane et al., 2013). Designed to draw on the findings from the MET study, the \$212 million-dollar Intensive Partnerships for Effective Teaching initiative (2009–2016) involved three public school districts and four charter management organizations experimenting with strategies aimed to produce dramatic gains in the achievement among pupils in low-income schools by improving the teacher workforce. The strategies—which related to measures of effective teaching, staffing policies, evaluation-linked professional development, and compensation and career ladders—were ultimately unsuccessful as the evaluators of the study found no overall increase in student achievement levels or graduation rates (Stecher et al., 2018). Nevertheless, the Gates Foundation remains an influential actor in educational policy debates, particularly in respect to teacher quality (Fejerskov, 2015; McGoe, 2016).

Conclusion

In sum, the types of non-state actors making up the GEI are many—ranging from edu-businesses, policy entrepreneurs, and multinational companies to philanthropists, foundations, and think tanks—and their impact on schooling and teachers' work is becoming increasingly apparent. The effectiveness of university-led teachers' professional preparation and development is being questioned, scrutinized, and in some cases de-regulated to create a quasi-market in which new, private providers can offer their services. Such private teacher training organizations may offer preparation that focuses on teaching practices and classroom experience based on what has worked well in raising pupils' test scores. Other non-state actors of the GEI such as low-fee private schools are opting to hire less experienced or unqualified teachers to deliver scripted (teacher proof) lessons in an effort to keep costs low and fidelity with the prescribed curriculum high. In such for-profit models of schooling, students and their families become customers and teachers' performance is increasingly linked to students' satisfaction and progress on national standardized tests. This trend is growing in school systems in developed countries. For example, a number of policy-makers across the US implement value-added measures through which teachers' performance is linked to their pupils' test scores on standardized tests. The rationale for value-added measures is linked to teacher effectiveness research and the need to hold teachers and, in some instances their preparation program, accountable for measurable learning gains. The growth in standardization and performance measures, linked to the global rhetoric in education fueled by the OECD, UNESCO, and World Bank among others, provides governments with the levers through which to steer and reshape the teaching profession and open the sector further to private non-state actors that claim to be able to meet performance targets more efficiently. Paradoxically, these claims often entail the expanded use of technology, online learning, and universally applicable pedagogies, while curtailing the pedagogical authority, autonomy, pay, and professional status of teachers whom they simultaneously claim are the key driver of learning.

Introduction

This is an interesting timeframe to write about teacher education for the *International Encyclopedia of Education*. Governments globally show an increasing aspiration to intervene in order to have greater influence, if not control, over the structure, content, and delivery of pre-service or initial teacher education (Furlong et al., 2009). The aspiration to intervene is supported by the consensus, at least in policy, that the quality of an education system largely depends on the quality of teachers and their preparation and credentials (Cochran-Smith et al., 2018). Historical analyses internationally show that teacher education has always been of key strategic significance in attempts to bring about change to teachers and teaching. Since the inception of formal systems of teacher preparation, initial teacher education has led the charge to reform and transform education systems, as the work of Rowe and Skoudombis (2019) on Australia, Grimmer (2009) on Canada, Assunção Flores (2011) on Portugal, Lewin et al. (2003) on South Africa, and Zeichner (2018) on the USA shows, to offer just a few examples.

What is new about the changes in teacher education in recent decades though is what Murray et al. (2019) called “a systematic politicization of teacher education” (p. 2). A main driver for this process is the progressively complex challenges encountered in the current, globalized world which increase governments’ aspiration to intervene and regulate teacher education in many countries across the developed and developing worlds. These challenges range from the global knowledge-based economy to the technologic revolution now entering all aspects of daily life, political instability in many regions, changing migration flows, and the COVID-19 pandemic which has radically challenged existing conceptions of schooling and teaching. Government intervention in specific localized contexts is also increasingly shaped by global and international influencers such as large-scale student assessments (e.g., the Program for International Student Assessment (PISA) and the Trends in International Mathematics and Science Study (TIMSS)) which are often cited as research evidence of the quality of an education system (Mayer, 2021). Such international comparative metrics spur domestic policy reform, especially but not exclusively by those at the bottom of the rankings who borrow models and policies from top performing jurisdictions (Grek, 2009). In short, the logic underpinning current teacher education policy is that government regulation and constant and rapid reform of teacher education is necessary in these wider uncertain times for an education system and a nation as a whole to stay internationally competitive, on top of the game, and in the market.

As major reforms in teacher education became more internationally visible in the 1990s and 2000s, the field of teacher education policy analysis grew steadily. The first generation of policy researchers in the 1970s and 1980s focused almost exclusively on schools and higher education (Steiner-Khamsi, 1999). The realization that these were not the only sites where changes were felt, invited research looking specifically at teacher education policy developments in the past two decades. Some of this work adopts a functional or historical lens to explain the development and nature of teacher education systems by their function (e.g., Ginsburg, 1998). This work is not the focus of this article. This article will rather focus on teacher education policy research and scholarship which takes a more critical approach and shares a view that “teacher education has been justified in different ways at different times” (Maguire, 2000, p. 228). These policy researchers share concern that reform not only shapes and changes the structures of teacher education, but also produces and reproduces particular normative discourses around the roles and purposes of teacher education and what it means to be a teacher which are not adequately addressed in historical-chronological accounts of teacher education (Maguire, 2000). The purpose of this article is to synthesize and examine what can be learned from this critical teacher education policy research during the past 15–20 years. The review of the literature is structured around two questions: (1) What is “the current teacher education” being constructed and reconstructed in teacher education policy legislation globally?; (2) What is “the current teacher” being

constructed and reconstructed in teacher education policy legislation globally? The current teacher education is a play on Cochran-Smith's (2005) description of "the new teacher education" in her AERA presidential address in 2005 with a particular focus on the USA. This article provides a much-needed update and expansion of her work 17 years after date.

Before embarking on this work, two important remarks need to be made. First, although the focus is on (re)constructing the current teacher education and the current teacher enacted in teacher education policy and reform, the analysis contains references to both "the old" and "the new" teacher education and teacher. The latter is taken up explicitly in the closing section of the article which builds an agenda for future research. Second, despite the goal of the article to identify and synthesize common patterns and trends across countries and institutions, I acknowledge that teacher education policies and practices are locally, historically, and culturally embedded. It is not my intention to gloss over these local variations. Rather, this article adopts what could be called a "global approach" to the review in that it attempts to identify common threads and global patterns, but with references to local research showing how these global trends have played out differently across various country and institutional settings where relevant and necessary.

The article starts with discussing in a broad way critical teacher education policy research, describing some of the assumptions and goals shared by those who engage in it. It is included to provide the general contours of this scholarship as I have come to understand it, as a way of orienting the reader to what follows.

Background and basic elements of critical approaches to teacher education policy analysis

What I labeled as "critical teacher education policy research" in the opening section of this article is not a field with marked boundaries. It is indeed a label that researchers operating within this field do not use themselves to identify their own scholarship. It is my personal and perhaps idiosyncratic view of an emerging and expanding subfield of education policy research, displaying a variety of theoretical and methodological stances and considerations. What unifies this work is first and foremost the understanding that schools and higher education are not the only places where changes such as standardization, decentralization, globalization, and marketization are felt (Steiner-Khamsi, 1999). These changes cut across all policy sectors (health, education, social and care services) and levels of education, including teacher education. Second, this work starts from the idea that policymaking is not "a deliberate process, undertaken by a bounded set of actors, who use research and reason to ensure the best possible policy outcomes" (Young and Diem, 2017, p. 2). Rather, it considers policymaking as a rhetoric process concerned with negotiation, contestation, power, and ideology. Policy problems are not self-evident facts awaiting government action, but social constructions or problematizations (Bacchi, 2010), and thus contestable and open to change. These researchers engage in research "of" policy rather than research "for" policy, borrowing Moore's (1996) binary. "The former positions the standpoint of the field, the latter is positioned by it" (Moore, 1996, p. 159).

In their review of critical policy work in education, Young et al. (2019) have found that researchers tend to focus their work around five critical concerns. It could be argued that these concerns also typify critical approaches to teacher education policy analysis:

- Concern regarding the difference between policy rhetoric and practiced reality
- Concern regarding the policy, its roots, and its development (e.g., how it emerged, what problems it was intended to solve, how it changed and developed over time, and its role in reinforcing the dominant culture)
- Concern with the distribution of power, resources, and knowledge as well as the creation of policy "winners" and "losers"
- Concern regarding social stratification and the broader effect a given policy has on relationships of inequality and privilege
- Concern regarding the nature of resistance to or engagement in policy by members of nondominant groups (Young et al., 2019, p. 6).

The history of critical approaches to teacher education policy analysis is, compared to policy research focusing on schools and universities, considerably short. To the best of my knowledge, there are no reviews of this work, nor systematic attempts to define "what counts as critical teacher education policy research." This scholarship has adopted a variety of perspectives and approaches. Examples include Phelan and Morris' (2021) Foucauldian analysis of policy texts in Australia; McGarr and Emstad's (2020) use of critical discourse analysis to offer a comparative perspective to teacher education reform mandates in Ireland and Norway; or Grimmett's (2009) macro-political perspective to examine the macro-political pressures at work in Canadian teacher education. Other examples include Snoek's (2021) use of a narrative approach to examine the conception of teacher quality in the Dutch policy context; Lewis and Young's (2013) utilization of Kingdon's Multiple-Streams Framework to examine how teacher education accountability has gained prominence on the governmental decision agenda in the USA; Furlong and O'Brien's (2019) employment of a phenomenological approach to decode the teacher educator identities constructed within an Irish context of reform; and Vanasche et al.'s (2021) positioning theory analysis of the normative discourses on teacher professionalism enacted in the latest teacher education reform in Flanders (Belgium). This non-exhaustive overview shows that the emerging field of critical teacher education policy research displays the same theoretical-philosophical and methodological diversity as reviews of critical education policy research more broadly have demonstrated (e.g., Ball, 1994, 1997; Young and Diem, 2017; Young et al., 2019).

What this scholarship does very well is also one of its pitfalls. That is, it pays significant attention to the local contexts and systems in which policy is made, favoring small-scale designs, and working from a national (or regional) framework of analysis, but often fails to reach beyond those local contexts. There have been attempts to adopt an international comparative perspective

with an increasingly broad geographic range (e.g., Adams and Tulasiewicz, 1995; Brock, 1996; Furlong et al., 2009; Darling-Hammond and Lieberman, 2012; Murray et al., 2019; Symeonidis, 2021; Mayer et al., 2021). However, most of this comparative work relies on what Steiner-Khamsi (1999) called implicit comparison methodology by which she means that teacher education reform in one national context is used as an analytical framework, and other reforms are contrasted with these developments; or analyses of reforms in different national contexts are presented together in special issues or edited books, as if the diversity and contrast displayed across individual contributions speak for itself. While there is a necessity for and great value in such efforts, I share Ball's (1997) concern that such policy research is "lacking a sense of 'place'" (p. 267) by which he referred to the lack of efforts to locate educational policies in frameworks that extend beyond the local level. Ball suggests a more direct analysis of the flow of policies between nations and related to that, the mediation of the global by the local pressures, concerns, and preferences, and *vice versa*. As he argues, "this is not simply a point about empirical description, although more of that would be very welcome, it is also about theorization" (p. 267).

This article is a first attempt to start identifying global trends in the normative and performative policy discourses on teacher education and what it means to be a teacher today, drawing on critical teacher education policy research in recent years across countries and institutional contexts. It offers my read of this expanding field of research. I will contend that the current teacher education is constructed as in crisis and in need of improvement, preoccupied with evidence and research, practical, and (willing to hold itself) accountable. This, in turn, invites related notions of teacher professionalism as essentially and frontally about knowing and performing "what works," being flexible and responsive to changing demands.

This configuration of the current teacher education and the current teacher is not exhaustive, nor do I claim that it characterizes any one teacher education policy setting or program globally. Rather consider this as a living configuration which focuses on common threads and patterns in the field that take different shapes and forms when enacted in specific localized contexts.

The current teacher education

Teacher education is in crisis and in need of improvement

The current teacher education is being constructed as "at risk," "in crisis," and "in need of improvement." This is not a new discourse. Historical analyses show that teacher education has always been assumed to be in some sort of crisis. Overlooking reform dynamics in ten countries, Tatto and Plank (2007), for example, describe teacher education institutions as operating in "an environment of permanent educational crisis" (p. 269). Beauchamp et al. (2015) similarly describe teacher education as always in turbulence, marked by contest and challenge, and receiving an insistent critique. The perception of crisis has become such a defining characteristic of teacher education because of three seemingly irrefutable assumptions. First, teachers are assumed to be the single most important factor in student achievement and learning (Delandshere and Petrosky, 2004). Second, student achievement is seen as a predictor of "individual and collective productivity and wealth in the economic argument of the Knowledge Economy" (Välimaa et al., 2016, p. 19). Third, the quality of teachers is assumed to be shaped by the preparation and credentials they received. In this permanent contest for comparative advantage, "it is no longer possible for school systems to be 'good enough'" (Tatto and Plank, 2007, p. 267). In a similar way, it is no longer possible for the current teacher education to be "good enough" and deliver "good enough" teachers.

The induced sense of crisis legitimizes governments' rights to intervene in the system in crisis (Trippstad et al., 2017). The only way to deal with (the threat of) crisis is to take powerful action and speed up the reform of teacher education, as is seen in many countries, "reflecting a belief that the creation of policy in and of itself suggests order, authority and expertise" (Clarke and Phelan, 2015, p. 258). Recent policy analyses of, among others, Simpson et al. (2021) in Australia, Vanassche et al. (2019) in England, Meijer (2021) in the Netherlands, and Cochran-Smith (2020) in the USA seem to suggest that the efforts for change in teacher education are increasingly being directed at both the structure and the substance of teacher education. This includes, for example, program accreditation criteria and auditing procedures, allowable routes into the profession, but also subject knowledge, pedagogical/didactical and fieldwork requirements, and prespecified outcomes (e.g., teacher standards). The current teacher education not only needs structural change and improvement, but also more substantial improvements to the focus, content, and delivery of its curriculum. The imperative for such substantive changes is built around the accelerated pace of reform in the current, globalized world assumed to pose qualitatively new demands on all levels of education, teacher education included (e.g., Madalińska-Michalak et al., 2018).

While the literature does not deny that teacher education stands in need of improvement, it also suggests that the image of crisis is in part a rhetorical or manufactured one (Clarke and Phelan, 2015), involving persistent questioning from policymakers and public media, often driven by international metrics which are taken as solid evidence of how well systems are performing. Nordin (2014), for example, demonstrated how this crisis discourse has been used by both national and transnational actors in the EU and in Sweden seeking public legitimacy for extensive reforms. Drawing on Beck's (1998) theory of risk society, he directs attention to the social production of risks in educational policymaking. In such a context, policymaking runs the risk of becoming nothing more than crisis management and "a narrow-minded enterprise of problem-solving instead of historically informed planning for a future society always different but still recognizable" (Nordin, 2014, p. 123).

In this context of urgent reform, and the lack of hard, technical evidence about the kinds of changes that will work, policy borrowing is rife (a.o. Chung, 2016; Kuhlee, 2017). This results in a convergence or sometimes copying of teacher education practices and policies across countries. At the same time, and somewhat ironically, policies in other countries travel in completely

opposite directions as they seek to raise standards in schools (Tatto and Plank, 2007). Successive neoliberal reforms over the past two decades in England, for example, have focused on making teacher education more of a school-focused and instrumental enterprise, influenced by the idea that more practical experience in and of itself produces (better) teachers (a.o. Furlong, 2013; Murray and Mutton, 2016). On the other hand, policies in contexts like Flanders (e.g., Vanassche et al., 2021), Finland (e.g., Aspfors and Eklund, 2017) and Norway (e.g., Smith, 2020), have strengthened the idea of higher education making a distinct and necessary contribution to pre-service teacher education, resulting in corresponding expectations for teacher educators to be or become research active.

Teacher education should be held accountable and wants to hold itself accountable

The current teacher education operates in an increasingly marketized environment in which governments lend teacher education institutions more autonomy and responsibility so that the teacher education market can regulate itself. At the same time, however, the autonomy of the current teacher education is limited by increased control and accountability toward government and public, especially in the face of challenges, looming crises, and policy's insistent spotlight on teacher quality. The current teacher education should be willing to continuously account for its processes and outcomes toward government and public in return for autonomy.

How the current teacher education is being held accountable, to what outcomes, and with what consequences varies considerably though across countries. Helpful is Barbana et al.'s (2020) distinction between two distinct global narratives in accountability policies: high stakes versus low stakes accountability. Although not specifically targeted at teacher education, these narratives translate well to recent teacher education policy developments. The first, high stakes narrative is mostly associated with the English-speaking cultural world such as the USA, England, and Australia where accountability policies have been installed in teacher education from the 1980s onwards (see e.g., Bales' (2006) historic analysis of the accountability shift in the USA). In these contexts, accountability policies are based on an implicit or explicit contract with specific targets and benchmarks for teacher education institutions and educators, and the risk of sanctions if these are not met. This form of accountability tends to be measurement-driven with a particular focus on outcome measures and a reliance on "external scrutiny to achieve its ends" (Sachs, 2016, p. 253). Teacher candidates' learning and, increasingly, pupil learning outcomes and achievement scores are examples of this (Cochran-Smith et al., 2010). Research indicates that in some of these contexts, accountability has led to increasingly sophisticated systems of surveillance and external regulation where teacher educators themselves experience little opportunities for self-regulation (a.o. Murray and Mutton, 2016; Rowe and Skourdoumbis, 2019). The second narrative, low stakes accountability, is often associated with continental Europe. Here, teacher education accountability contracts are more implicit and low scores obtained by programs or institutions do not necessarily and in each case not directly result in formal sanctions "apart from an incentive to think about one's practices in the light of the negative feedback" (Barbana et al., 2020, p. 89). Such forms of responsive or reflexive accountability are less concerned with the outcomes than the process, and focus more on the ability of the current teacher education to regulate itself (Sachs, 2016).

Recent analyses seem to suggest that traditionally low-stakes accountability countries like Belgium, Norway, Sweden, Poland, Portugal, and the Netherlands, slowly move toward high(er) stakes accountability policies. Smith (2018), for example, characterizes Norwegian teacher education as operating in an increased accountability culture, inducing "a feeling of being made answerable for changes which are not yet institutionalized and resolved before new requirements are made accountable to redesign programs" (p. 22). She attributes increased accountability pressures to the uncritical adaption of international and European trends, including the framework for quality assurance systems developed by the European Commission which was obediently and faithfully implemented in the Norwegian context. The result is a tension between trust and mistrust of institutions, programs, and educators in Norwegian teacher education. Snoek and Dengerink (2016) noted similar patterns in the Netherlands. The establishment of the *Dutch Accreditation System for Higher Education* in 2002 is an early sign of the introduction of governance principles in Dutch teacher education with a tension building between, on the one hand, the government's intention to ensure quality in the face of critique and on the other hand, the importance of flexibility and autonomy for teacher education institutions for innovation and renewal. Snoek and Dengerink frame the profession's initiative to develop a *Knowledge Base for Teacher Educators* in 2012 as strategic action to avert increased government control and intervention, at times when concerns around the quality of teachers and teacher education were growing.

Teacher education is evidence-based

The current teacher education emerging from contemporary policy discourses is based on evidence. Its curricular decisions are not (only) based on custom or professional judgment, but on evidence about what strategies "work" and make the biggest impact on candidates' learning and the learning of pupils in their future classrooms. The current teacher education is "in an 'evidence era', where actions are justified through a language shrouded in talk of research, data, and best practice" (Helgetun and Menter, 2020, p. 2). The assumption is that with more and better evidence "practitioners and policymakers at all levels will make better decisions, and teacher quality will improve" (Cochran-Smith, 2005, p. 8).

What is being constructed as credible evidence for the current teacher education is two-fold. On the one hand, the literature exposes an insistent belief in research to deliver evidence. There is a call for increasingly sophisticated research approaches to inform the current teacher education. Consider, for example, the OECD report *Evidence in Education* which calls upon researchers to address the "need to make causal claims" (Cook and Gorard, 2007, p. 44) and the corresponding "ethical need for researchers to use

something like a randomized controlled trial to make these claims responsibly" (p. 44). For the current teacher education based on evidence, causal questions have a special importance and "identifying 'what works' deserves a special status among the concerns of those accountable for the quality of educational performance, as does learning about 'what works' in the most secure ways" (Cook and Gorard, 2007, p. 34). A second trusted source of evidence for the current teacher education is all other data available from internal, external, and increasingly transnational accountability activities. This includes, for example, internal data from institutions' own quality assurance procedures, external data from audits and inspections, but also more distant evidence such as pupil achievement scores on national and international metrics (e.g., TIMSS and PISA). Here, the evidence discourse combines with the accountability discourse. In the process of making teacher education quality transparent for all stakeholders involved, measurable outcomes are created, and those numbers in turn deliver evidence for the necessary changes in teacher education curricula, programs, and institutions, especially from a comparative perspective.

The current teacher education not only effectively uses evidence and research developed by others. It also creates evidence itself when asked for by external evaluators or to check whether a program meets its own standards for good teaching (Cochran-Smith, 2005). Increasingly, teacher educators engage in self-study or related forms of practitioner research to work on the improvement of their own practices and programs, and the profession as a whole (Kitchen et al., 2020). Some countries, especially those with dual systems of higher education, have also seen increasing pressures on teacher educators to become research active (a.o. Czerniawski et al., 2017).

The logic is that with more and better evidence (i.e., evidence that demonstrates the effectiveness of practices and graduates), the current teacher education will make better decisions about the content and delivery of its curriculum, but also be able to respond to the insistent critiques from the public, including parents and policymakers. Grossman (2008), for example, claims "a profession is most vulnerable to attack when serious questions can be leveled at the perceived effectiveness of its practice" (p. 13). While acknowledging that responses to critiques coming from the public "will always be driven by normative assumptions, professional judgment, and ethical commitments" (p. 13), Grossman stands that the profession's responses to critiques "would be substantially enhanced as well as more professionally responsible and publicly credible, if we had a sounder research base with which to refute their claims or support their own" (p. 13). Again, the logic is clear: the current teacher education should be based on evidence about what works, and the profession itself carries responsibility for putting in the effort and developing the skills to determine how its practices and programs make a difference. This evidence preferably takes the form of the outcomes that the public and governments care about most, that is, classroom performance of teacher candidates and pupil achievement, and preferably the relationship between both (Cochran-Smith et al., 2010).

Teacher education is practical

The final defining piece of the current teacher education is that it should be (more) practical. As Kosnik et al. (2016) articulate, "there is considerable comment around the world about the excessively theoretical and abstract nature of traditional teacher education courses" (p. 273). Their observation mirrors the conclusion of an OECD report published in 2010 which, looking across OECD countries, urged for greater "complementarity between field experience and academic studies" (Musset, 2010, p. 46). The report encourages countries to "establish shared responsibility between teacher education institutes and schools in the training of teachers, in order to fill the theory-practice gap" (p. 46). This quotation exposes the logic underpinning policy trends globally to make teacher education more practical: increasing the amount of time teacher candidates spend in schools will produce better teachers (Kidd and Murray, 2020).

This "practice turn" (Reid, 2011) has been a hallmark of teacher education policy reform globally for some time now. It "is in some respects a 'turn around'" (Reid, 2011, p. 211). The idea that newcomers in the profession can learn from the observation and interrogation of demonstrated practice of experienced teachers is a familiar discourse in teacher education policy. The principle of building the curriculum of teacher education on the activities and practices in which teachers engage is also one that, as Zeichner (2012) argues, "has been used in some form for many years" (p. 376). The pendulum swing between theory and practice not only figures in policy discourses. It also shows in the revival of scholarship on practice-based approaches to teacher education (a.o. Grossman, 2021) which first appeared in the literature in the 1970s and 1980s, particularly in the USA.

Like the other pieces of the current teacher education, the (re)emphasizing of practice is a global policy pattern that has played out differently across countries and institutional settings. In some countries, like England, Australia, and parts of the USA, this has resulted in "the far-reaching development toward a school-based teacher education system" (Gilroy, 2014, p. 624) with "limited (or no) emphasis on research or 'theoretical' course work" (Goodwin and Kosnik, 2013, p. 335). School-led and apprentice-style teacher education programs are providing alternative routes into the profession. The growing global network of *Teach for All* is a point in case. In countries evidencing such a strong pull to practice, "the principle of Higher Education making distinctive and necessary contributions to ITE has been steadily eroded in the multiplicity of providers and routes now involved in the 'marketplace' of school-led ITE" (Vanassche et al., 2019, p. 480). The relocating of teacher education into schools has been associated with shifting conceptions of teaching as a craft or applied science with "little theoretical learning and little learning of any kind, beyond mastering the routines of the cooperating teacher's classroom" (Zeichner, 1992, p. 297; see also White and Forgasz, 2016). This not only has consequences for the enacted discourse of teacher professionalism, as I will detail below; It also shapes and changes the workplace landscape and position of teacher educators. The current teacher education is no longer the unique province of higher education-based teacher educators. Large and various groups of school-based teacher educators join the ranks, often constructing their professional identities as teacher educators around their first-order practices in schools. Higher education-based teacher educators face

derogation of their expertise, feeling “less able to compete with school-based teacher educators in meeting the demands of immediate practice” (Brown et al., 2015, p. 7). In other countries, particularly in continental Europe, the practice turn has rather taken shape as a “practicum turn” (Mattsson et al., 2011), resulting in an increase in field experience and partnership models. In the Netherlands, for example, so-called “training schools” were established in which schools and teacher education institutions work alongside each other to educate teachers. These government-funded training schools transform the traditional practicum into guided work-based education (van Velzen, 2013).

The current teacher

Teacher education policies carry related assumptions about the kinds of teachers necessary if quality teaching is to be realized. This section aims to identify what form of teacher professionalism and what kinds of teachers are called for in teacher education policy legislation globally. In line with previous work, I use the term professionalism “as a descriptor of what makes up the essence of being a teacher and the (characteristics of the) knowledge, skills and attitudes invested in the work” (Vanassche et al., 2021, p. 28). The trust of the argument is that policy discourses of teacher professionalism have shifted the past decades from the teacher as a professional who relies upon subject matter and pedagogical knowledge and values to enact practice, toward the teacher as a technical expert who knows and can perform what works, as derived from research on effective teaching. The current teacher is also flexible and responsive to the always changing needs of the society, schools, and pupils.

Although the section below, mirroring the available scholarship, mainly discusses the effects of contemporary policy developments for teacher professionalism, it is easy to see how these discursive shifts also pertain to teacher educators. I return to this observation in the conclusion of this article.

Teachers know and perform “what works”

Current teacher education policy, and its combined focus on evidence and practice, leads into a conception of “professionalism as effective intervention” (Biesta, 2007, p. 7). It starts from “the idea that professionals do something (...) in order to bring about certain effects” (p. 7). The frequent use of terms like “effective teachers” and “effective teaching,” and the related emphasis on “evidence-based practice” and “evidence-based teaching” in recent teacher education policy documentation globally reflects this orientation. Teacher professionalism is increasingly framed “in the technical scheme of ‘what works/does not work’” (Vanassche et al., 2021, p. 35). The current teacher’s classroom strategies and behaviors are among the most efficient and effective available. In such a context, the primary task for the current teacher education is to train candidates who know what works and are able to perform and replicate that in their classrooms. This suggests a policy turn that shifts teacher education back toward a teacher training paradigm (Cochran-Smith, 2005; Beach and Bagley, 2013).

The demarcation of “what works/does not work” draws on the kind of empirical evidence also advocated for in the strengthening and development of the current teacher education. That is, “scientific research programs that seek the determinants (or variables) of effective teaching and teacher education, and build a knowledge base for use by teachers” (Vanassche and Berry, 2020, p. 11). The value of such research for teachers is increasingly “judged according to the use or not of prescribed methodologies” (Mayer, 2021, p. 6; see also Cook and Gorard, 2007). For questions of a causal nature, like effectiveness issues (i.e., does a classroom strategy produce the intended effect?), preference is given to robust experimental and quantitative designs. As Vanassche et al. (2021) have argued, this not only shapes and defines what counts as valid research, but also evokes a technical and rather linear relationship between practice and research. In such a logic, they argue, “teacher professionalism concerns the application of a research-informed body of knowledge to solve problems” (p. 35). Much like the current teacher education, the current teacher implements insights and evidence from research with fidelity. The term “fidelity” refers to the notion of treatment fidelity in clinical settings. To assess if a drug works, it needs to be administered under specified conditions in the prescribed dosage at prescribed time intervals. The current policy environment urges teachers to implement proven strategies as planned, or with fidelity. Consider, for example, Sanetti et al.’s (2021) advice to teachers, whom they address as “research consumers,” to “implement an evidence-based intervention in their classes (...) with fidelity (...) as students may not respond positively to an intervention they did not receive as intended” (p. 5). If a problem does arise under such conditions, the most likely explanation is faulty implementation rather than a faulty strategy. This shows how current policy discourses tend to minimize teacher discretion, and in some cases suppress teacher reflection (Bourke et al., 2016).

The conception of teacher professionalism as knowing and performing what works carries the related assumptions that professionalism is fairly generic and context-free, and can be mapped and checked (Vanassche et al., 2021). In many policy contexts, this is materialized in the development of teacher standards or competency frameworks. Standards offer a presumably exhaustive list of knowledge, skills, and attitudes that present best evidence and can be reasonably expected from teachers. Most countries have standards in place for experienced teachers but also slimmed down starting requirements for beginning teachers outlining what they “should know at the conclusion of a professional teacher education degree program” (Bullen et al., 2010, p. 47) and, increasingly, entry requirements for programs of pre-service teacher education serving as predictors of future teacher performance (Parker, 2018). Standards are considered key policy instruments in efforts to raise educational standards. Especially in countries with high stakes accountability narratives, the standards take a regulatory approach (Sachs, 2016) in that they are owned and imposed by the government and used to regulate the profession with consequences for those who do not fulfill the standards (i.e., access to tenure, higher

pay scales, etc.). In other, low(er) stakes contexts the standards “emerge through consultation among various stakeholders and are, in the main, profession led, rather than bureaucratically imposed” (Sachs, 2016, p. 256). In contrast to regulatory standards, such developmental standards are concerned with development and improvement of teacher and student performance. But regardless of the purposes and use of standards, the policy logic is clear: what makes up the essence of (good) teachers can be defined, and we can get better at that as scientific research makes significant progress in mapping what works and the conditions under which it works. These insights can then be used as a template for the selection and training of newcomers to the profession.

Research has documented how such a technical-instrumental view of teacher professionalism oversimplifies the teaching and learning process, because it fails to address context and makes obsolete discussions around the purposes of education in policy and practice. The instrumental view of teacher professionalism currently installed in teacher education policy globally leads to a view of the professional teacher as “one who ‘does things right’ rather than one who ‘does the right things’” (Darling-Hammond, 1990, p. 31). The question “what works” takes precedence over the question “what it should work for” (Biesta, 2007). In such discursive contexts, disagreement “becomes limited to varying views as to the best means by which instrumental goals can be achieved; dissent regarding the purposes of education becomes off limits” (Clarke and Phelan, 2015, p. 259).

Teachers are responsive and flexible

Overlooking the teacher education policy literature, researchers appear to be highlighting a contrast and in most countries a shift from two contrasting models of teacher professionalism and the virtues associated with it. Researchers in different contexts have used various nomenclatures, but broadly speaking they signal a shift from profession-oriented discourses in teacher education policy environments to market-oriented discourses, terms borrowed from Simons and Kelchtermans (2008). The conception of the teacher as professional is associated with professional virtues of expertise, responsibility, and autonomy. The professional teacher is someone who claims and owns the responsibility to teach based on his/her subject matter knowledge and pedagogical knowledge to teach a particular subject. “Policy is ‘profession-oriented’ when it acknowledges that teaching and teacher education (programs and institutes) rely upon specific (educational or pedagogic) values or upon a particular scientific, theoretical framework and particular study subjects” (Simons and Kelchtermans, 2008, p. 288). That is, policymakers acknowledge and give room for the specific values and professional knowledge which “govern” teaching and teacher education. Such a focus on professional and institutional autonomy (Olssen et al., 2004) does not prevent government intervention, but government intervention is used with caution and is positioned as a complement to the profession’s self-governance. By contrast, the kind of teacher currently called for in policy is not someone who owns the freedom to teach based on specific values and professional knowledge, but someone “who makes sure that what s/he offers provides an appropriate answer to the needs of the society, the school and the pupils” (Simons and Kelchtermans, 2008, p. 292). Current policy discourses replace professional responsibility by responsiveness and attentiveness to the always changing needs of the school system and society at large. The current teacher is on top of her/his game and able and willing to flexibly adapt to changing needs. The policy demand for such teachers is constructed around the increasingly complex challenges presented by the modern world, such as rapid developments in ICT, a changing labor market, and shifting demographics in society and schools. In sum, teacher education policy seems to promote a managerial (Sachs, 2016) and organizational (Evetts, 2009) view of professionalism, replacing profession-oriented values (i.e., expertise, responsibility, autonomy) with market-oriented or corporate values (i.e., effectiveness, responsiveness, and flexibility) (Simons and Kelchtermans, 2008).

As Gewirtz et al. (2009) argue, it is too simple to argue that one form of professionalism has completely overhauled the other “because in reality the two kinds of professionalism are more likely to coexist” (p. 7). Nevertheless, looking at the teacher education policy literature across national contexts, the balance between both forms of professionalism seems to be shifting. Consider, for example, Tessema’s (2007) examination of policy directives in Ethiopia. Reform mottos such as “active learning,” “competence” and “participatory” increasingly evidence a managerial approach to teacher education, a term he uses to denote policymakers’ focus on strategic planning and management of teacher education and teachers, reflecting a corporate style structuration of the profession. “It is a process that ignores pedagogical and educative arrangements such as teacher research or inquiry, continuous pedagogical dialogs or deliberations, pedagogical innovations and sharing, pedagogical voluntarism and activism, and collaborative engagements for increased professionalization and ownership” (p. 41). In Tessema’s view, such a conception of managerial professionalism “sidesteps pedagogues and pedagogy in favor of fulfilling instrumental, central and market-oriented agendas” (p. 29) and peripheralizes teachers in the Ethiopian context. Beach and Bagly’s (2013) two-way comparison between the discourses of professionalism enacted in Swedish and English teacher education policy mirrors these findings. “Sweden has, to a degree, resisted global neo-liberal educational policy and refracted its ambitions differently to other countries, while the UK has seemed to embrace these policies and was one of the first countries to adopt them” (p. 380). Despite these different logics, Beach and Bagly’s analysis of the effects of changing teacher education policy on the sense of professionalism in both countries revealed marked similarities in terms of an increasing need for teacher education institutions, educators, and students to flexibly adopt and “respond to (and integrate into teaching and practice) a constantly shifting prescribed list of behaviors, competencies and standards, against which their professional work will be assessed” (p. 389). These examples show evidence of the effective, responsive, and flexible teacher hinted at by Simons and Kelchtermans (2008).

The rise of the managerial prerogative across jurisdictions has been attributed to the increased focus on accountability, standards, and performance in education policy (Mayer, 2021), but also to global forces, such as globalization and neo-liberal reform agendas. Although some of these agendas have taken longer to reach some countries, particularly in continental Europe, “what we seem to be

witnessing today are the effects of a common global discourse of neo-liberal teacher education reform that varies primarily only in terms of being spoken in national, local and/or regional dialectal forms: ‘same, same, but different’, as Sjöberg (2011) so eloquently put it” (Beach and Bagly, 2013, p. 389). In sum, the teacher emerging from education policy across the world not only knows what works but is also flexible and responsive to changing demands made by pupils, society, and policy priorities.

What’s next?

The current teacher education emerging from the literature is one that draws on evidence and research to make decisions about the preparation of teachers and work on necessary improvements in the face of crisis. It legitimizes its existence based on its relevance for practice on the one hand and by accounting for the outcomes and effects it produces with teacher candidates to government and public on the other hand. Teacher education policy also carries implicit visions about desired forms of teacher professionalism which have changed considerably over the past 15–20 years. The teacher currently called for in policy texts is one that knows and can perform what works, as derived from teacher effectiveness research. S/he is also flexible and responsive to the always changing needs of the society, schools, pupils, and policymakers.

At the risk of over-simplifying, there is a basic tension at the heart of the relationship between the policy level and teacher education institutions in many countries. A tension between trust and mistrust, terms borrowed from Smith (2018). A huge amount of trust—or even faith—is placed upon teacher education and teaching as vectors of educational reforms of all kinds, of individual and collective prosperity and competitiveness. The policy spotlight on quality teaching suggests that this trust has perhaps never been greater. At the same time, however, the abilities of the current teacher education and teacher to meet those high expectations are mistrusted. The main issue causing tension between trust and mistrust in many countries are accountability systems holding teacher education and teaching accountable to increasingly narrow outcome measures, such as teacher candidates’ classroom performance and pupil learning outcomes.

This living configuration of the current teacher education and teacher across policy contexts shows the convergences in policy orientations across the world. Countries evidence a degree of cross-national attraction in the global policy arena, inviting policy borrowing, in some countries around an increasingly “limited menu of change” (Darling-Hammond, 2012, p. ix). Global and pan-European organizations such as the OECD and the European Commission have intensified these processes through sharing of best practices and evidence, often from a comparative perspective. Moreover, this research synthesis suggests that some policies travel the world in rather specific directions. There appear to be “leading countries,” that is, countries that have shown glimpses of what I described as the current teacher education and the current teacher years before it emerged as a more global configuration. A point in case are the accountability pressures detected in the USA and England in the 1980s now slowly conquering continental Europe. Critical policy research often uses these early adopters as the proverbial canaries in the coalmine for late adopters, drawing on comparative references to “caution against educational reform” (Ochs, 2006, p. 602) or, in some cases, “glorify current education at home in comparison to other nations” (p. 602). More research is needed to understand these policy dynamics.

An important question to address at this stage is what’s next? What are future directions for this growing field of research? First, I reiterate the need for more explicit and direct comparisons of teacher education policy discourses and practices across contexts. Such research would allow to better understand the traveling of policies between countries and the mediation of the global and the local in teacher education policy processes. This work necessitates a careful balance between the increasing globalization of ideas and the national, regional, and local enactments of those ideas. This balance needs to be made at every stage of the comparative work, from choosing an appropriate theoretical-analytical framework to deciding on the level of analysis and sources of data. Second, there is a need to include insiders’ perspectives (i.e., teacher educators, teachers, teacher candidates, program leaders, etc.) in the analysis of (shifting) policy orientations. I am reminded of Ball’s (1997) call to “people policy.” The phrase pushes back on the view “that policy is something that is ‘done’ to people” (p. 270) in that they either implement it or are advantaged or disadvantaged by it. The teacher education profession is shaped by, but also helps to shape the discourses and practices described above. Ball’s call to people policy research is a call to actively include the “sort of people and ‘voices’ [which] inhabit the texts of policy analysis” (p. 271) in research. For example, Webb et al. (2004) deliver a comparative analysis of primary teacher professionalism in England and Finland. They confronted policy text analysis with interviews of teachers. Interestingly, the interviews showed teachers welcomed increased government intervention in the Finnish context which had been traditionally built on notions of professional autonomy. Implementing government-imposed directions in literacy and numeracy “that deliberately targeted pedagogy—arguably the last preserve of teacher professionalism—led teachers to claim enhanced professionalism” (Webb et al., 2004, p. 102) as the reforms reduced uncertainty about their role and “[redressed] the increasing inequity and inconsistencies within the system that were of direct concern to them” (p. 103). This shows the value of including insiders’ voices in macro-debates about teacher (de-)professionalization. Third, teacher education policy legislation not only produces normative discourses around what it means to be a teacher today; It also shifts discourses around what it means to be a teacher educator. Consider, for example, Vanassche et al. (2019) analysis of how policy changes in England have resulted in narrower, more instrumental, and school-centered forms of teacher education. In such a context, legitimacy as a teacher educator increasingly centers around practical knowledge of teaching with university-based teacher educators being positioned as out of sync with the demands of the profession. This is but one example of the impact of changing policy discourses on teacher educators’ work, lives, and professionalism which need to be explored further.

Introduction

Teachers’ work and learning are heavily influenced by the specific policy conditions within which they are practiced. Current policy conditions are characterized by increased pressures for improvement on particular measures of student attainment. Increasingly, these measures reflect broader concerns and discourses about the nature of curriculum provision, the quality of teaching, and student outcomes—particularly outcomes on national and international standardized tests of literacy and numeracy, and increasingly, science. Understanding the nature of current curriculum, teaching and assessment provision in this policy context is a first step to fostering conditions productive of more substantive alternatives.

This article draws upon Carol Bacchi (2009) influential work on policy analysis, and especially how particular issues come to be framed as “problems” of a particular kind. These understandings are applied to current conceptions of teachers’ classroom work and learning. Bacchi’s (2009) notion of “What’s the problem represented to be?” is helpful for making sense of current perceptions of teachers’ work and learning—particularly the push for increased standardization—and how such practices have come to be manifest in policy and practice.

What’s the problem represented to be?

Bacchi (2009) work implies that policies always constitute issues in particular ways, presenting a particular set of circumstances that will frame how such issues might be addressed. Bacchi (2009) research enables us to better understand “how governing takes place”, “how order is maintained”, and “how we live within and abide by rules” (p. ix). Government policy does not need to construct these issues as overt problems per se, but instead implies that particular kinds of reform need to take place in order to foster what is construed as necessary change:

Most government policies do not officially declare that there is a problem that the policy will address and remedy. Rather this is implicit in the whole notion of policy—by their nature policies make changes, implying that something *needs* to change.

Bacchi (2009, pp. ix–x).

Such an approach challenges more rationalistic notions of government as responding and responsive to some sort of readily comprehensible or generally shared understanding of an issue or concern, and enacting particular “solutions” understood as generally or widely accepted. As Bacchi (2012) argues:

It starts from the premise that what one proposes to do about something reveals what one thinks is problematic (needs to change). Following this thinking, policies and policy proposals contain implicit representations of what is considered to be the “problem” (“problem representations”) (p. 21).

Consequently, it is important to make *explicit* that which is construed as *implicit* about the particular “problem” at hand. To elicit these more explicit understandings, Bacchi (2009) proposes six questions:

- (1) What is the “problem” ... represented to be in a specific policy?
- (2) What presuppositions or assumptions underlie this representation of the “problem”?
- (3) How has this representation of the “problem” come about?
- (4) What is left unproblematic in this problem representation? Where are the silences? Can the “problem” be thought about differently?
- (5) What effects are produced by this representation of the “problem”?
- (6) How/where has this representation of the “problem” been produced, disseminated and defended? How could it be questioned, disrupted and replaced? (p. xii)

Problems are therefore constructed in particular ways, emphasizing some issues and matters over others, silencing alternatives and establishing dominant modes of understanding and interpretation. Such selectivity also reflects representations as deeply political and indicative of how specific politics at play always constitute “a web of decisions and actions that allocates values” (Easton, 1953, p. 130)—constituting some values as much more authoritative than others.

The notion of policy here is also understood as eclectic. Ball (1994) argues policy constitutes not only recognizable administrative documents oriented to the enactment of specific political prerogatives but also associated texts, including legislation as well as the broader contexts and discourses associated with such texts. Policy also entails the outcomes or effects of such texts. For Ball (1994), “[p]olicy is both text and action, words and deeds; it is what is enacted as well as what is intended. Policies are [also] always incomplete insofar as they relate to or map on to the ‘wild profusion’ of local practice” (p. 10). Such an approach makes it possible to draw upon a multitude of perspectives from a variety of actors engaged in both developmental and enactment processes and analysis of the circumstances within which such work occurs. Collectively, Bacchi (2009) and Ball (1994) ideas are particularly useful for making sense of how teachers’ work and learning are currently constituted within official policy contexts, texts and effects, and how they might be constituted differently.

I apply Bacchi (2009) theorizing to understanding the broader political and policy context in which teachers’ work and learning are currently constituted and enacted. Bacchi (2009) argues it is important to “make the ‘problems’ implicit in public policies *explicit* and to scrutinize them closely” (p. x; emphasis original). Specifically, I draw upon broader research literature about politics and policies associated with teachers’ work and learning to try to shed light upon how such work and learning are currently understood in policy, including in order to shed light upon the implications of such contextual circumstances for both teachers and students’ learning.

The policy problem: Insufficiently detailed curriculum, lack of teaching standards, and poor student performance

In relation to education provision in schools, the primary “problem” is often characterized as one of inadequate or insufficient “educational excellence” or “attainment” or “outcomes”. At national and global scales, this is manifest in the push for enhanced results on national and international large-scale assessments, and pressure to ensure a comparative advantage against other countries participating in such tests (Verger et al., 2019). These results are also linked with the nature of the curriculum developed in different national contexts and the way such curricula are enacted in teaching/pedagogical practice. Each of these “message systems” of curriculum, pedagogy and assessment (Bernstein, 1971) reflect particular concerns about educational provision. However, these practices of curriculum development, pedagogical practice and assessment do not exist in isolation but are instead reflective of the broader policy conditions within which they are expressed. These policy conditions are not only specific to particular locales, but also often “global” in orientation, even as they are expressed very differently in specific policy contexts (de Sousa Santos, 2006).

Broader, global policy conditions

More localized curriculum, teaching and assessment practices are framed within a broader policy and political context characterized by increased pressures for improved outcomes and the attainment of such outcomes as efficiently as possible. Contrasting processes of neoliberalism and managerialism operate alongside one another, with current broader policy conditions manifesting such emphases in multiple and contradictory ways. Reflecting more managerial influences, different modes of ranking and measuring have been utilized as “indicators” for the purposes of presenting and re-presenting the activities to both those within these organizations as well as to various external stakeholders and publics (Shore and Wright, 2015). Such responses are the manifestation of what have been referred to as various kinds of “audit cultures” (Power, 1997; Strathern, 2000) that seek to manage and monitor educators’ practices. The proliferation of such cultures is reflective of substantive change and reform, and not simply a passing fad or proclivity. As the name suggests, the adoption of such audit cultures also implies the infiltration of auditing practices more typically associated with accountancy and finance. Such practices are often technicist in orientation and reduce to what can be captured through specific, often metric, modes and markers of achievement. Such processes seek to exclude contestation, oriented as they are as alternatives to what is construed as problematic judgment on the part of teachers. Such judgments are

construed as needing to be not simply augmented but superseded by a much more authoritative “measure” of student learning and performance. Under such circumstances, processes of standardization and quantification become dominant, even as they fail to capture the nature of actual student learning and educational practices more broadly (Hardy, 2015), and even as educators seek to “appropriate” more performative practices for educative purposes (Hardy, 2014). The development of such numbers also present something of a quandary, given that may have the potential to be educative, even as they are simultaneously limited by the parameters of their development (Hardy, 2020).

Alongside more managerial practices and processes, more neoliberal influences have also exerted influence. Even as notions of neoliberalism are heavily contested in educational research (Rowe et al., 2019), it is possible to identify various processes of “neoliberalization” (Peck, 2010), whereby market reforms have been variously implemented, involving processes of regulatory restructuring on the part of governments as they seek to implement a multitude of reforms across the public sector—including public education. Competition between schools is encouraged as a means of ensuring greater efficiency of educational provision, and improved outcomes.

In relation to education, these broader policy conditions have been increasingly influenced by what Sahlberg (2016) describes as the “Global Education Reform Movement” (“GERM”). GERM constitutes the common education policies governments have sought to promote to improve the quality (and more recently, equity) of their schooling systems. These policies emphasize: (1) increased competition between schools and systems; (2) setting standards for schools, teachers and students, resulting in increased standardization of practices across these contexts; (3) narrowing the curriculum to focus on core subjects in schools—particularly literacy and numeracy, and science; (4) using corporate management models as a vehicle to drive improvement, and; (5) high stakes testing for accountability purposes as a vehicle to determine the quality of teaching and educational provision more broadly (Sahlberg, 2016). While such processes are sometimes seen as a vehicle to enhance autonomy of schools by reducing more bureaucratic structures and processes, they simultaneously increase external control upon what occurs in schools through stronger emphases upon accountability, increased attention to standards and more frequent testing. These processes are part of what Robertson (2016) describes as the “thickening” of global governance of teachers’ work. Such “thickenin” is evident in both developing and developed contexts through the influence of external bodies such as the World Bank and the OECD. Such bodies have variously advocated new tools for the governance of teachers’ conditions, work and pedagogical practices, which have become increasingly linked to students’ outcomes as a means of maintaining accountability. Tools such as the OECD’s *Teaching and Learning International Survey* (TALIS), the OECD’s Education GPS and the World Bank’s SABER-Teacher (Systems Approach for Better Education Results) all contribute to these global governance processes.

Standardized curriculum

Arguably, these more neoliberal and managerial approaches foster increased standardization of school curriculum provision. Concerns about curriculum have been long-standing issues within educational research with earlier concerns about the “hidden curriculum” (Apple, 1977) continuing to exert influence but now existing alongside concerns about how curriculum have become increasingly homogenized, particularly in light of the increased emphasis and influence of high stakes testing. Construed by Au (2011) as the “new Taylorism”, such approaches emphasize accounts of curriculum as dominated by testing and scripted curricula. These curricula are often of a pre-packaged, corporatized variety, and oriented to providing resources to prepare students to be successful on various high stakes state and national tests that have exerted increasing influence. This is perhaps most obvious in the United States, where curricula autonomy has been reduced since the passing of *No Child Left Behind* in 2001 in particular, and where local school districts across the United States have felt restricted in the nature of the literacy curriculum they feel they are able to provide to their students (Vaughn et al., 2019). Recent research across nine schools in the US reveal the substantive effects of such prescriptive approaches on curriculum reform at state and district levels, and how teachers are marginalized from decision-making in relation to who decides on the nature of the curriculum, and how these decisions are made (Vaughn et al., 2019). This is due in large measure to the way in which teachers have not been adequately represented in decisions about curriculum reform more broadly, as broader neoliberal logics have sought to foster a form of “closure” around what it is possible to teach (Hardy and Uljens, 2018). Furthermore, prescriptive literacy programmes have become increasingly prevalent in the US context with educators pressured to ensure they are teaching according to district and state reading guides (Powell et al., 2017).

However, these logics are always manifest within local settings, and influenced by the particular circumstances in which such ideas “touch down”. In reflecting upon curriculum reform scholarship in Europe, Yates (2016) identifies how researchers seek to make sense of broader “global” influences, but also how curricula are always national or sub-national in character, and how more localized approaches and foci need to be taken into account. Similarly, in their comparative analysis of Australian and United States national curriculum reforms, Savage and O’Connor (2015) argue a broader global policy-scape (Carney, 2012) has exercised influence over time, influencing the nature and flow of transnational policy ideas, including in relation to concerns about economic competitiveness as well as equity. However, these ideas are also always mediated at national and sub-national levels and via the varying conditions of possibility that exist in each context.

Standardized curricula arrangements can also be manifest in the form of more conservative political rationalities. Reflecting a conservative response to an increasingly fractious polity in England, Winter and Mills (2020) refer to how curricula construed as promoting “British values” have become increasingly pervasive in a broader context of concerns about terrorist attacks and potential radicalization of students in English schools. Reflecting the high-stakes nature of such concerns, the notion of “British values”

forms part of the British Government's Counter-Terrorism and Security Act, 2015. In this way, curriculum becomes narrowed to particular government foci and agenda, and often without adequate regard for subsequent effects.

These standardized curricula may also be the product of key non-governmental bodies in specific national settings. [Tarlau and Moeller \(2019\)](#) refer to how philanthropic foundations in the Brazilian context influence policy making for curriculum reform. This is part of a broader trend of increased influence of philanthropic organizations in educational provision more broadly ([Bhanji, 2016](#)). This reflects the ways in which corporate organizations are gaining increased influence in education to varying degrees in different countries around the world ([Ball, 2012](#)).

Of course, how curricula play out are still influenced by the educators involved in their enactment. From a Chinese context, [Fu and Clarke \(2019\)](#) refer to how teachers exercise moral agency even in the context of neoliberal influences in the way they seek to enact curriculum reform. While China's examination-dominated education system continues to exert strong influence, more competitive logics, including more recent neoliberal logics that contribute another dimension to such competitiveness, have been able to be challenged. Such responses build on earlier efforts to try to reduce memorization and promote increased inquiry skills among students, fostering collaboration and more independent thinking on the part of students ([Zhong, 2006](#)). The development of morals among students, together with a broad conception of knowledge and well-being are prioritized over the dominant exam-oriented curriculum even as the latter continue to exert influence, including in its more recent neoliberal instantiations.

Standardized teaching

The proliferation of teaching standards also reflects efforts to control teaching, and the pervasive influence of standardization of pedagogical practices. Such standards are designed to identify key attributes or qualities of "effective" teaching practice. However, such approaches also have the effect of compartmentalizing and atomizing teachers' work, and fail to adequately capture the necessarily creative and unpredictable nature of actual teaching practice. Increasingly, such standards have become associated with teachers' capacity to make sense of various forms of evidence/data about students' learning, particularly in relation to assessment.

The tightening focus upon assessment alongside issues of pedagogy contributes to what [Lewis and Holloway \(2019\)](#) refer to as the datafication of the teaching profession (2019). This is a teaching profession in which an emphasis upon data dominates teaching practice, and in which teachers are construed as those who "profess" data. Such an approach contributes to the reconstitution of teaching in ways that affect both the practices of teachers and how they come to understand their work. In this context, [Lewis and Holloway \(2019\)](#) argue more numeric data become "effective" at changing what is considered most important within the profession/what "counts", and "affective" in the way data constitute new expectations that teachers will constantly speak to—"profess"—the importance of data. Under such circumstances, teaching becomes increasingly "datafied". This process occurs from the earliest stages of schooling; [Bradbury and Roberts-Holmes \(2018\)](#) refer to the datafication of primary and early years' education in what they describe as the "data obsessed" school. Data in these instances become productive of data-driven subjectivities on the part of both students and teachers, as each is exposed to and seeks to be responsive to the broader external push for enhanced outcomes on specific, reified forms of data. Such processes essentially promote quantitative measures of student achievement, simplifying the complexity of actual learning and treating such numbers as proxies for forms of learning that cannot be easily captured or made "visible" to external audiences.

At the same time, teachers' work and learning are also dominated by discourses of "quality" and how to promote quality teaching and quality education. This is manifest in multiple contexts, including contexts as diverse as Norway, Netherlands, Australia ([Hardy et al., 2020](#)) and Chile ([Mizala and Schneider, 2019](#)). [Robertson \(2016\)](#) describes this focus upon "quality" of teachers in education systems around the world as a global phenomenon. While [Robertson \(2016\)](#) argues this global governance of teachers is not new, the way in which it is expressed at present is different, and worthy of further scrutiny. The earlier OECD (2005) report *Teachers Matter* was a key vehicle to focus attention upon teacher quality, with overriding concerns about economic competitiveness driving pressure for reform. More recently, the TALIS, Education GPS and SABER-Teacher have sought to provide much more detailed information about the nature of teachers and their work across national contexts, and some of this information, such as TALIS material, has been brought into conversation with PISA results as part of the engagement with such data ([Robertson, 2016](#)). These data also enable comparisons between countries in ways similar to how PISA results are deployed. However, and reflecting the inherent tensions that characterize efforts to standardize teaching practices, the kinds of teaching practices advocated in countries that have traditionally been construed as more successful in PISA (such as Finland) do not exhibit the sorts of teaching practices distilled within the OECD's programs as characterizing supposedly successful schooling systems ([Sahlberg, 2016](#)).

Further complicating this situation, these more homogenizing processes are always and everywhere influenced by a broad array of sub-national, national and supra-national actors and agencies. By way of example, and drawing upon the Australian context, [Savage and Lewis \(2018\)](#) reveal how the Australian Professional Standards for Teachers (APST), while purportedly "national" in character, reflect the influence of sub-national (New South Wales state government agencies), national (Australian federal government) and supranational bodies (OECD). The resulting "national" standards reflect the influence of each of these bodies, including the impact of various transnational entities. Such standards may be considered a form of global techno-scientific enterprise even as they are also always manifest in place-specific ways ([Lewis et al., 2019](#)).

Standardized assessment

Perhaps the most overt instance of the standardization of schooling is in the area of assessment. Educational governance is increasingly influenced by testing practices and associated enumerative accounts of achievement. Such accounts enable demands for increased performance, particularly as measured against various national and international large-scale standardized tests. In many ways, standardized testing has served as the leading motif of the Global Education Reform Movement (GERM) with its focus upon standardized test results as a key vehicle to ascertain the effectiveness or otherwise of national and sub-national educational systems, and of various curriculum and pedagogical reforms (Sahlberg, 2016). Verger et al. (2019) argue that national large-scale assessments serve as the policy vehicles that knit together the principal GERM policy principles of accountability, standards and school autonomy. Interestingly, Verger et al. (2019) argue these principles have begun to “infect” those countries that had previously been more resistant/“immune” to the push for increased pressures of accountability associated with standardized measures of attainment; Hardy et al. (under review) provide particularly salient insights in this regard in relation to the earlier Finnish “miracle”. Increasingly, national large-scale assessments have been used for accountability purposes and as a means of keeping track of educational outcomes and the extent to which more standardized curricula and learning standards have been implemented. Smith (2016) refers to a “global testing culture” which is characterized by census-style standardized testing tied to high stakes outcomes. Such tests have become increasingly high stakes not just for students but for teachers. In the United States, for example, these stakes are clearly evident in the way pressure to ensure improved student performance of students influences teachers’ understandings of their work. In a comparative analysis of an earlier Bush-administration push for enhanced standards through *No Child Left Behind* (NCLB) legislation, and the later Obama-administration *Race to the Top* (RTTT) emphasis upon enhanced “value-added” measures of teachers’ performance, Holloway and Brass (2018) identify a fundamental shift in teacher subjectivity. This entails a move from being responsive to what was considered an external intrusion upon teachers’ autonomy and sense of professional identity and practice through NCLB, to a sense that the measures put in place through RTTT became significant markers by which teacher came to know themselves and their work, and the quality of this work. Within such discourses, teachers also come to constitute themselves as constantly needing to work on themselves and their deficiencies—as “perpetually imperfect” (Holloway, 2019)—as indicated through these external markers of attainment. Effectively, the accountability logics that inform this process have come to dominate such that teachers’ very sense of self is constituted in terms of the practices and processes of standardized evaluation processes.

Reid (2019) provides interesting insights into the nature and effects of PISA as the archetypal mode of standardized testing. The way in which the test has taken on such status is reflected in how national governments have focused on the test as a vehicle to evaluate educational quality internationally. The Australian government, for example, passed the Australian Education Bill, 2013, which legislated the aspirational goal of Australia being positioned in the top five countries for PISA by 2025 (Reid, 2019). It is the comparative aspect associated with the ranking of such testing that gives PISA its authority. While PISA reports span multiple volumes and thousands of pages, including multiple supplementary files outlining how various numbers have been generated, it is “the production of a few numbers that capture most of the attention” (Sellar et al., 2017, p. 27). While it is the overall rankings of countries that are emphasized, this hides the fallacious nature of such comparisons, even just at a technical level, given the degrees of error that attend such tests; at best, error coefficients make it erroneous to rank countries beyond grouping countries as “high”, “average” and “low” performing (Sellar et al., 2017).

Nevertheless, such international numeric indicators garner much attention. The fixation upon specific numbers constitutes what Muller (2019) describes as the “tyranny of metrics”, with its capacity to capture and constitute the broader social practices in ways that better enable surveillance and regulation of human (in this case, educational) practices. This is the case in relation to all nation-states, but felt particularly keenly in those countries not considered highly “ranked”; the national eye becomes rearticulated through the global eye as comparative logics dominate (Nóvoa and Yariv-Mashal, 2003; Auld and Morris, 2014).

So, what’s the problem *really* represented to be?

Given these broader conditions, after Bacchi (2009), one can rightly argue, “what’s the problem [*really*] represented to be” (Q. 1) in how teachers’ work and learning are understood? This overview of broad insights into the nature of curriculum, pedagogical and assessment practices within and across varied contexts reveals the “problem” as one of a lack of educational quality as understood against key, comparative numeric indicators, and the need for increasingly standardized curriculum and teaching practices to foster enhanced outcomes—particularly as measured against national and international standardized assessment instruments. Concerns about teachers’ abilities to develop substantive curriculum are reflected in calls for more standardized curricula. At the same time, the emphasis upon standards development and more standardized and increasingly scripted teaching practices (e.g., “direct instruction” approaches) reveals a lack of trust in teachers’ pedagogies, and the need to isolate and codify what are construed as “effective” practices. On Bacchi (2009) analysis, the “problem” is represented to be insufficient rigorous and detailed curriculum that can be readily “transposed” across multiple and diverse contexts, to inform insufficiently knowledgeable teachers. The “problem” is one of “quality” and “standards” in relation to pedagogical/teaching practice. Finally, in relation to assessment, the “problem” also appears to be principally performative, and one of inadequate evidence of sufficient and competitive attainment on standardized national and international literacy and numeracy (and increasingly, science) tests.

In relation to [Bacchi \(2009\)](#) second question about the assumptions that underlie such an approach (Q. 2), such representations assume that shortcomings in curricula, teaching and assessment provision can be rectified through this higher level of curricula specificity, increased attention to the nature of students accepted into teaching and their subsequent pedagogical practices, and even more focus upon testing of “the basics” of literacy and numeracy. What is less recognized is the complexity of teaching practice *in situ*, and how teaching is always a grounded practice requiring substantive judgment and trust in teachers as professionals and “intelligent” systems of accountability to evaluate these practices ([O’Neill, 2013](#)); what is also lacking is a more developed sense of trustworthiness in general, particularly in relation to issues of honesty, competence and reliability ([O’Neill, 2018](#)).

How we have come to this point is an interesting question (Q. 3), and one that rewards close scrutiny of the litany of reviews and reforms that characterize educational provision throughout the world. The principles of the Global Education Reform Movement (GERM) have clearly had significant influence ([Sahlberg, 2016](#)), including in supposedly more successful jurisdictions, such as Finland ([Hardy et al., under review](#)). Constant processes of comparison between nation-states’ educational performance against standardized and limited measures of student achievement have led to advocacy for similarly standardized and limited approaches to curriculum and teaching—all in an effort to better control, so as to supposedly improve, teachers’ work and learning.

On the question of what is left unsaid through such problematization (Q. 4), this approach fails to recognize the limitations of more restricted curriculum, teaching and assessment practices. It assumes that increased standardization of curriculum will somehow automatically result in enhanced learning on the part of students, without adequate regard for the nature of the teaching transpiring, or actual evidence of its effects. The contrary effects created by the “data obsessed school” ([Bradbury and Roberts-Holmes, 2018](#)), and the unrelenting focus upon “perpetually imperfect teachers” ([Holloway, 2019](#)) are given less attention. Such an approach also fails to adequately consider the importance of context, particularly for those students who are most disadvantaged and for whom teaching practices based on constant efforts to increase standardized test results leads to an enervating experience of schooling that can hardly be described as “educational”. Such processes are exacerbated by what [Biesta \(2015\)](#) refers to as the social psychology of international large scale assessments such as PISA, with their emphasis upon the importance and value of numeric and comparative measures of achievement, the persistence of technical renderings of education, and the way in which concerns about social justice are deployed as a key justification for trying to understand and capture how schooling systems are performing.

Such a response results in unintended and often problematic effects (Q. 5). These include policy settings that seem impervious to evidence to the contrary. In the Australian context, for example, a relative decline in students’ literacy, numeracy and science results in the latest (2018) PISA results has led to increased calls for even more attention to “back-to-basics” curricula, and teaching approaches that are “evidence-based”, where, in a process of abject circularity, such evidence is limited to results on yet more standardized literacy and numeracy tests. This is the case even as there are always instances of challenges to these problematic practices (e.g., [Zhong, 2006](#)).

The issue of how/where this representation of the “problem” has been produced, disseminated and defended (Q. 6) focuses attention upon the broader politics that surround schooling provision around the world at present. Again, drawing upon the Australian case as an example, the federal government’s concern and anxiety to ensure improved outcomes in both national and international test results serves as a powerful vehicle for the continued focus upon such results, and as a challenge to alternative, more critical discourses. Even as more standardized approaches are revealed as having deeply problematic effects ([Reid, 2019](#)), they continue to be supported by governments seeking to find ways to “capture” and “improve” educational provision in schools. That this is a global problem is reflected in the way international organizations have played a key role in such codification processes. This includes through the OECD’s Teaching and Learning International Survey (TALIS), Education GPS and the World Bank’s SABER-Teacher (Systems Approach for Better Education Results)—all of which contribute to these broader global governance processes ([Robertson, 2016](#)).

Broad principles to inform an alternative approach to educational policymaking

However, even as there is evidence of such homogenizing processes, more critical approaches and alternative responses to standardization agenda exist. The final part of [Bacchi \(2009\)](#) final question (Q. 6)—How could this “problem” be questioned, disrupted and replaced? (p. xii)—demands consideration of the possibilities for alternatives. The focus upon more reductive approaches to engaging with data has not gone unchallenged. Adopting a more materialist approach, Madsen (2019) argues for a “configurative agency of metrics” as a mechanism to rearticulate excessive emphases upon the more performative processes of “governing by numbers” and various processes of governing education through data ([Ozga, 2009](#)). Such an approach is construed as a way for actors involved in education to engage with data more substantively.

Such approaches do not simply denigrate more quantified approaches to understanding student and teacher work and learning; datafication processes are not homogeneous but also reflective of the particular social, political, cultural and material conditions within which they are exercised and that contribute to their very development. As [Takayama and Lingard \(2018\)](#) argue, while existing studies:

offer valuable insights into the processes and effects of educational datafication, the lack of national and regional diversity could obscure the fact that datafication of schooling elsewhere might take different forms and assume different ontological meanings. More problematically, it could constrain our ability to explore different ways in which datafication can be conceptualized and its effects understood and to ask a different set of questions that are perhaps more relevant to other national and regional contexts (p. 3).

However, this is never a simple process. In recent work (Hardy, 2020), I have referred to the “quandary of quantification” to capture the way in which processes of the quantification of education and more performative logics intersect, constituting a problematic set of circumstances within which more enumerative renderings of practice may be understood in simply reductive terms. At the same time more quantified approaches can focus attention upon some areas of teachers’ work and learning that can benefit from further inquiry and scrutiny. But this must be undertaken in context and in the clear understanding that standardized measures of educational attainment cannot capture important and necessary practices that are genuinely educational. Any social practice, including practices of teachers’ work and learning are always undertaken in specific settings; practice is never divorced from context. Philosopher Theodore Schatzki (2002) captures this situatedness of practice through his conception of practice as situated—the “site of the social”—and Kemmis et al. (2014) have taken up this situatedness of practice in their advocacy for changed conditions for education provision *in situ*.

Such an approach is cognizant that some forms of standardized data may be able to be deployed for educative purposes. It is not simply that data derived from standardized tests are inherently “bad” but rather that such data are often/frequently used for problematic purposes, including for purposes for which they were never originally intended. This is most obvious in relation to various standardized national literacy and numeracy tests that are described as providing some policy-relevant insights into the effects of educational provision at a national level, but which may then be used to evaluate individual students, teachers and schools. Such unintended consequences have become so common in some settings as to be normalized, resulting in those in schools—students, teachers, school administrators—accepting that they should be held to account for such results, even as they simultaneously recognize the limited and reductive nature of such measures of attainment; Holloway (2019) analysis teacher evaluations as an ontological framework that dominates teachers’ practices is particularly salient in this regard.

Of course, the challenge for educators as processes of standardization and accountability exert ever greater influence is how to balance the tension that such approaches produce with the possibilities that may arise to use such data for more substantive educational purposes. As Reid (2019) argues, processes of accountability remain important, but not in the way they are currently constituted, which are antithetical to the forms of educational provision that need to characterize educators’ practices as they strive to ensure their students are as ready as possible for the uncertainties of the worlds in which they will live and work:

It is important to make the point at the outset that a critique of the neoliberal accountability regime is not an argument against accountability. Gathering evidence—both quantitative and qualitative—is crucial in order to inform all those who have a stake in the quality of our education systems about how things are going. It assures taxpayers that government funds are being spent wisely and appropriately; advises parents about the quality of their child’s education; tells educators about areas that need work; and assists policy-makers in making decisions about such matters as resource allocation. But it is the form that accountability takes that is at stake here. It is argued that when approaches to accountability are narrow and pinched—as are those associated with the standardizing agenda—they can only serve to severely constrain what is needed for a futures-focused education. That is, it is pointless devising an educational program for the future, only to allow it to be sabotaged by accountability strategies that are incompatible with it (p. 79–80).

Importantly, even as broader more performative policy logics have significant impact, counter-narratives that challenge the standardization phenomenon are evident, and exert influence. In his case for creating curriculum for an uncertain future, Tienken (2017) calls for American educators to “defy standardization” as they seek to foster curricula opportunities that take into account specific district, school, classroom and student needs. With their concern for how to foster more socially just schooling practices, Francis et al. (2017) also point to the need to engage with issues of social justice, even as such issues are fraught with contradictions and dilemmas. Gert Biesta (2019) call for “obstinate education”, which seeks to ask difficult questions about society and sustainability in the quest for more democratic and just practices, fosters the sorts of counter-narratives that have the potential to be more genuinely educational for all—not just those already privileged or able to garner the most resources, often at the expense of social, political, economic and environmental sustainability.

Conclusion

Consequently, an analysis of teachers’ work and learning under current policy conditions is powerfully informed by focused attention upon the nature of curriculum, pedagogical and assessment practices in schooling policy provision, and how such provision is enacted in practice. Bacchi (2009) provides a particularly useful analytical toolbox for better understanding the nature of education provision in and through policy, and as a stimulus for considering how to foster more substantive policy settings for alternative practices. Her insights reveal increased pressure for control over curriculum and teaching/pedagogy, and how these have been achieved through more standardized assessment practices for accountability purposes. These accountability purposes are often infused by performative rather than educative logics, and are less “intelligent” in their orientation than they need to be (O’Neill, 2013, 2018). Consequently, the “problem” of the need for increased “standardization” actually reveals a need for the very opposite—for space, and opportunity for teachers to develop context-responsive curricula and to be able to teach such curricula in engaging ways, particularly for those students most marginalized by dominant schooling

practices. Such an approach helps set the groundwork for more “authentic accountabilities” (Hardy et al., 2019; Hardy, 2021), which will rearticulate the “problem” of educational provision in schooling settings toward social, political, economic and ecological sustainability, and better focus our attention upon practices more likely to lead to enhanced learning toward such sustainability for both teachers and students.

The past three decades have brought educational reform on an unprecedented international scale. The advent of the "information age" and "network society" (Castells, 2010), wherein "networks constitute the new social morphology of our societies, and the diffusion of networking logic substantially modifies the operation and outcomes in processes of production, experience, power, and culture" (Castells, 2010, p. 500) has seen "educational borrowing and lending" (Steiner-Khamsi, 2004), enacted at an ever increasing pace, with policy flows ever more global in scale. At the same time, the increasing tendency of Western democracies toward neoliberal ideas in education and other areas of social policy has seen a growing fixation on the measuring and auditing of all things educational, as responsibility—but not necessarily control—over educational outcomes is shifted to the level of the local and the individual. Teachers' work has become an important point of focus in this continuing reform of education systems internationally, with the re-emergence of "teacher centrality" (Larsen, 2010, p. 208), "the assumption that the key to educational success lies with the teacher", as a driver of reform.

The contemporary manifestation of teacher centrality has been leveraged variously by national Governments (e.g., Australian Government, 2016; Department for Education UK, 2016), prominent shapers of teachers' professional knowledge and development internationally (Hattie, 2008), and other key players such that it has become consolidated as a key "regime of truth" (Foucault, 1980) within the past 30 years. In a recent OECD report, for example, Andreas Schleicher stated "it is a given that the quality of an education system can never exceed the quality of its teachers. So, attracting, developing and retaining the best teachers is the greatest challenge education systems have to face" (OECD, 2019, p. 4). Explicit efforts aimed at improving teaching practice and "quality", including upon entry to the profession, therefore constitute one aspect of the policy context for teachers. Also important, however, are reforms which while not ostensibly targeted at teachers, nonetheless impact on and shape their work, including, for example, moves toward the standardization of curriculum, pedagogy and assessment, which have been a key part of the global reform agenda.

In this article we examine the implications of the key tenets of the global reform agenda for teachers' work, taking the Australian context, where ongoing changes to education policy reflect a range of core concerns, as a case study. We suggest that local articulations of globalized education policy reshape the "practice architectures" of teachers' work, impacting the cultural-discursive, material-economic and social-political arrangements that "constitute enabling and constraining preconditions for the conduct of practices" (Kemmis et al., 2014, p. 31). These arrangements effectively operate to govern such work, opening up and closing down different possibilities of practice. While we do not assume any kind of prior "golden age" of teacher autonomy or empowerment—teachers "have always been under the yoke of surveillance and normalizing state control" (Smaller, 2015, p. 150–151)—we do argue that the current articulation of teacher centrality has particular implications for their work within the present historical moment. Through reference to the Australian experience, we posit that the sum total of these reforms looks less like a pursuit of "teacher quality" than a reshaping of their role, labor and discretion along lines of performativity and competition, unlikely to assist in the goal of "attracting, developing and retaining" (OECD, 2019, p. 4) outstanding teachers.

The article proceeds in three parts. In the first, we locate our discussion of Australian reform of teachers' work with respect to both the Australian national and educational context and the Global Education Reform Movement (GERM) (Sahlberg, 2016). In the second, we consider the aspects of contemporary reform in Australia as they connect to the tenets of the GERM, and their implications for the work of teachers. In the final section, we take a step back to consider some broader implications of these reforms, using

the theory of practice architectures as a touchstone, in terms of the reshaping of the arrangements that govern teachers' work and the implications of these for the teaching profession.

Background

The Australian context

Historically, school education in Australia is a responsibility of the states, a residual power retained after federation in 1901. Slowly but surely, this settlement has been eroded, particularly since the 1970s with increasing federal intrusion into state-run schooling (Campbell and Proctor, 2014). Perhaps the most formal avenue for such intrusion is the Education Council. While a series of inter-governmental forums for discussion of education have been in place since early in Australia's history as a nation, the establishment of the Council of Australian Governments, or COAG, was a key development. Under this umbrella, the intergovernmental Ministerial Council on Education, Employment, Training and Youth Affairs (MCEETYA) was established in 1993, the body now referred to more simply as the Education Council (educationcouncil.edu.au). The Education Council is an important forum, producing National Declarations on schooling successively since 1989, with the most recent being the Mparntwe or Alice Springs Declaration (2019), successor to the Melbourne Declaration (2008). These documents remain important guiding statements on national school education.

Under the auspices of these policy documents have come a range of other federal moves in the Australian schooling space. One of the most notable has been the influence of the Rudd/Gillard Labor Government from 2007 to 2013, which came to power on an "education revolution" electoral platform and pursued vigorous reform in relation to schooling during its tenure. Under this government pre-existing, nascent plans for a national curriculum and nation-wide standardized testing were amplified, passing the Australian Curriculum, Assessment and Reporting Authority (ACARA) Act in 2008 enabling the establishment of ACARA as a significant national body. Via this "new national policy organization" (Savage, 2016, p. 837) the Australian Curriculum was progressed, and the national standardized testing program (National Assessment Program—Literacy and Numeracy, or NAPLAN) was established, its results published on a new national, comparative choice-based website, My School (www.myschool.edu.au). The Rudd/Gillard government also boosted the power of the Australian Institute for Teaching and School Leadership (AITSL), a body responsible for the management of teacher accreditation via nationally agreed teaching standards which had previously been state-based. This government also established a significant review of school funding popularly known as the Gonski Review (Gonski et al., 2011), which led to the passing of the Australian Education Act 2013—the first act of federal parliament to govern school education—and a significant revision to funding mechanisms for Australian schools, both government and non-government. Subsequent to this initial Gonski review, however, was what has become popularly known as "Gonski 2.0" (Gonski et al., 2018), primarily a review of how government funding for schools should be spent. Gonski 2.0 was initiated by the subsequent (and, at time of writing, current) Liberal-National Coalition government, elected in 2013, which was also responsible for the establishment of the Teacher Education Ministerial Advisory Group (TEMAG), reflecting a shift of focus from schools to how their teachers are educated within the tertiary sector.

It is this group of government bodies: the Education Council, ACARA and AITSL—supported by adhoc groups and committees such as TEMAG and the reviews of school funding committees including Gonski and Gonski 2.0—that constitute the main organizations responsible for shaping federal education policy in Australia today. Fig. 1 highlights the relationships between federal and state and territory governments and these bodies, and the key policy reforms each has been responsible for since 2007.

Fig. 1 Key Australian education policy reforms since 2007.

The global education reform movement

In the discussion that follows, we use Sahlberg's (2016) notion of the Global Education Reform Movement, or GERM, as an organizing framework for understanding education reform in Australia and articulating this on an internationally comparative scale. The GERM is said by Sahlberg to consist of five policy drivers: competition and choice; standardization of teaching and learning; focus on reading, mathematics, and science; corporate models of change; and test-based accountability. Sahlberg's acronym and model has spurred broad academic interest. A recent special issue of *Educational Review* similarly uses the GERM as an organizing framework (Fuller and Stevenson, 2019). In this section, we provide a brief and necessarily limited summary of some of the ways in which the GERM has been addressed within the international research literature, in relation to teachers' work.

When it comes to teachers and their work as a subject of the GERM, the international literature has tended to focus mostly on the issues of standardization, corporate models of change and test-based accountability. In relation to the standardization of teaching and learning, it is evident that the use of teaching standards is now ubiquitous (Darling-Hammond, 2012; Storey, 2006). As Sahlberg (2016, p. 142) writes, there is an assumption within GERM-related reform "that externally set teaching standards and aligned standardized testing are preconditions for success". Another arena of standardization has been within initial teacher education, with the accreditation not only of teachers but of teacher education programmes and ongoing professional development beyond initial teacher education (see e.g., Conway, 2013; Mockler, 2022). In other contexts, the "failure" of teacher education has seen the opening up of particular forms of "entrepreneurship" around alternative pathways into teaching, such as in England (Ellis et al., 2019). Elsewhere in higher education policy we have seen the introduction of Teacher Performance Assessments, argued to have arisen from "a construction of the problem of teacher education [as] lack of accountability and standardization of expectations" (Cochran-Smith et al., 2013, p. 16), and to have been based on a logic of professionalization that can, for instance, be in conflict with conceptual ideals of critical pedagogy (Sato, 2014).

Standardization of student learning has also been evident in the introduction of testing frameworks which can narrow the focus on in-school teaching and learning, with research in the United States suggesting a shift to "teaching to the test" and engaging in more teacher-centered pedagogical methods (Au, 2007; Sahlberg, 2016). This also relates to the function of corporate models of change, where research has suggested that teachers now work within forms of managerial rather than regulatory accountability in national contexts as diverse as the United States, Mexico, Chile, Brazil, China, and Germany (Holloway et al., 2017), increasingly through the use of student test scores via national large-scale assessments, as another interwoven feature of the GERM (Verger et al., 2019). Perhaps the most explicit and drastic example of test-based accountability for teachers has been seen primarily within the United States, with the controversial use of student test results as measures of teachers' work through the use of "Value-Added Modeling" tied directly to individual teachers, but with considerable problems of validity and reliability (Berliner, 2013). Also relevant in relation to corporate models of change has been devolutionary reform, as has been seen for instance in Sweden, and how this can lead to differentiated conditions for teachers (Parding et al., 2020). Globally, the international literature has been less interested in the impacts of devolution on teachers than on students or broader questions of social justice—with some exceptions (see e.g., recent research out of China critiquing the effects of decentralization and external accountability on teacher agency (Fu and Clarke, 2019)).

As we noted in our introduction, however, it is not only these aspects of reform most closely related to teaching and learning that have impacts on teachers' work. Other policy technologies, including those related to competition and choice between schools and school systems, and a focus on reading, mathematics and science, have also have effects for teachers—for instance as Sahlberg (2016, p. 138) describes, increased competition between schools can affect "the cultures of teaching". Such modes of impact on teachers have seen less attention in the international literature. In this article, we seek to take a broad view of policy informing and impacting teachers' work, and look across the major reforms in Australia to explore these effects. In particular, we focus on the major reforms to school education identified at federal level and highlighted in Fig. 1, which constitute the central and most significant national reforms over the past decade. In doing so, we highlight both consonance and dissonance across the Australian teacher policy settlement, and how this may be understood on a global scale.

The GERM and education reform in Australia

In this section, we canvas particular manifestations of the GERM in Australian school education and review the research on these policy shifts. In doing so, we also aim to highlight where and how teachers have featured within these shifts and debates. While we have structured the discussion below around the five central tenets of the GERM, we recognize that in practice, these tenets are not discrete. Test-based accountability, for example, might be seen as a technology of competition and choice, linked also to the standardization of teaching and learning. For this reason, while we have used the cultural-discursive, material-economic and social-political arrangements suggested by these tenets as a touchstone in the discussion, in the final section of the paper we provide a more integrated discussion of the practice architectures of teachers' work as suggested by the GERM in Australia.

Competition and choice

Competition and choice is a central aspect of the school education policy settlement in Australia, which boasts an "extreme" form of marketized schooling via a large, fee-charging yet publicly-funded private sector complemented by considerable differentiation

across public schools (Windle, 2015). This settlement has primarily attracted attention in terms of its impacts on schools, students and parents. Competition and choice are theoretically meant to have a social-political effect of "lifting all boats" (Chubb and Moe, 1990). The Australian research literature, however, has primarily documented the residualization of schools that are not "chosen" (Campbell and Sherington, 2013), exacerbating compositional effects for students increasingly segregated by level and nature of advantage (Bonnor and Shepherd, 2016), as parents (typically those of the middle class) engage in considerable, often gendered forms of labor (Proctor and Aitchison, 2015) to make the "right" school choice for their children (Campbell et al., 2009). Notably, this settlement remains despite the recent, large review of school funding known as the "Gonski Review" (Gonski et al., 2011), which while critiquing the ways in which funding was distributed across public and private schools did not ultimately question the provision of such funding and maintenance of a publicly-funded choice system in itself (Morsy et al., 2014).

Other research relating to choice and competition has documented impacts on teachers. With student populations segregated across school settings, "monolithic notions of the teaching experience" (Stacey, 2020, p. 164) have been shown to be inadequate, as vastly different school contexts constitute contrasting places of employment, both in a material-economic and social-political sense. Research suggests that in this divided system, teachers can experience both structural and pedagogical "lock-in" effects that limit their movement across different types of schools (Parding et al., 2017), as they come to know and feel comfortable within particular kinds of settings (Forsey, 2010; Stacey, 2020). There have also been shifts to the kinds of work undertaken in schools in relation to market positioning (Stacey, 2020).

An important part of how school choice and competition are fostered has been the advent of the My School website which presents, for each school, the results of national, standardized testing via NAPLAN (discussed further below). This move has arguably taken the technology of NAPLAN, which was designed to provide a national snapshot of student achievement, to a mode of accountability, with the public presentation of results described explicitly at the time as intended to encourage parents to "vote with their feet" (AustralianPolitics.com, 2008), driving competition between schools and their teachers. A wealth of research since has outlined these cultural-discursive, material-economic and social-political shifts and the effects on teachers of this focus on the core subjects which constitute such standardized measures, as discussed further below.

The emphasis on competition between schools that is epitomized within the Australian school choice regime is arguably consonant with a broader theme of competition between nations, also evident in the national (and international) focus on PISA rankings, where education is positioned as a tool for improved economic success in global terms. This cultural-discursive arrangement, or way of talking and thinking about the role of education, is expressed in the most recent national declarations on Australian schooling. In the 2008 "Melbourne Declaration" (Ministerial Council on Education Employment Training and Youth Affairs, 2008), some commentators have seen a primarily economic driver in the discursive constructions of the document (Buchanan and Chapman, 2011). While other analyses have seen this as balanced with a strengthening of "the individual's tendency toward compassion, the development of contemplative capacities, perseverance and open-mindedness" (Carter, 2019, p. 133), Savage (2011) has argued that the long-articulated dual goals of "equity" and "excellence" in education sit uncomfortably next to, and possibly work in tension with, each other. This cultural-discursive settlement, with attendant impacts on social-political arrangements via the instrumentalization of teachers' work, appears to be persistent. Early analysis of the subsequent Alice Springs (Mparntwe) Education Declaration (Education Council, 2019), suggests that it essentially continues the economic and human capital focus of its predecessor (Hogarth, 2020).

Standardization of teaching and learning

Similarly, moves toward standardization of learning and teaching, embodied predominantly in the Australian Curriculum, and TEMAG and Gonski 2.0 reports, suggest particular cultural-discursive, material-economic and social-political arrangements that frame and govern teachers' work, forming part of the "practice landscape" (Kemmis et al., 2014) on which their work is enacted. Indeed, to a large extent, the suite of policy reforms is underpinned by an implicit assumption that increased standardization is of benefit to students and student learning, and will shore up "teacher quality" in Australian schools.

Since its inception, the Australian Curriculum has been positioned as a "learning entitlement" for all Australian students (National Curriculum Board, 2009, p. 11), and this language of "entitlement" has increasingly been amplified in successive *Shape of the Australian Curriculum* papers (ACARA, 2010, 2011, 2012) such that in the current iteration of the document it is expressed as follows:

The Australian Curriculum describes a learning entitlement for each Australian student. It sets out what young people should be taught ... and an expectation of the quality of their learning. (2012, p. 15)

Further, the curriculum "makes clear to teachers what is to be taught" (ACARA, 2012, p. 13). This, together with the language of entitlement, points to a shrinking "discretionary space" (Comber and Kamler, 2009; Weaven and Clark, 2015) for teacher judgment and decision-making and, as Brass and Holloway (2021, p. 5) have argued in relation to the United States, a consequent displacement of teachers' "professional discretion in matters of curriculum and pedagogy" at the hands of the national curriculum.

Such standardization has of course been experienced differently across the eight Australian states and territories, whose governments hold responsibility for the provision of schooling and the oversight of curriculum. In New South Wales, traditionally thought

of as having the highest level of curriculum standardization and regulation prior to the Australian Curriculum (Reid, 2018), the shift was far more minor than other states, such as Queensland, where the adoption of the Australian Curriculum gave rise to state-developed resources known as the *Curriculum into the Classroom*, with scripted lesson plans mandated by many school principals (Barton et al., 2014; Wall, 2017).

In both the TEMAG *Action Now: Classroom Ready Teachers* (Craven et al., 2015) and "Gonski 2.0" *Through Growth to Achievement* (Gonski et al., 2018) reports, standardization of teaching and learning is linked discursively to the drive toward "teacher quality", which is underpinned by a commitment to "best practice" and "what works". An emphasis of the TEMAG report was on the role of initial teacher education to address issues of teacher quality and achieve "best practice" in both initial teacher education and schooling, and its recommendations have seen associated shifts toward control of initial teacher education entrants, discussed further below. Meanwhile the Gonski 2.0 report emphasizes the need to establish what "works best" in teaching as a foundation for proposing a "formative assessment tool", currently under development, designed to guide "evidence-based decisions" and provide "suggestions for teaching strategies, professional learning and student learning activities based on evidence and best practice" (Gonski et al., 2018, p. 65).

Increased focus on reading, mathematics, and science

One of the "local vernacular" (Rizvi and Lingard, 2010) iterations of the Global Education Reform Movement in the Australian context was the inclusion of History (along with the more commonly regarded "core" subjects of English, Mathematics and Science) in the first iteration of the Australian Curriculum. While the development of an Australian national curriculum had been on the agenda for the Keating Labor Government in the early 1990s, the project was abandoned due to the inability of the federal Government to procure agreement from the eight states and territories. The idea of a national curriculum for Australia was next advanced in 2006 when conservative Prime Minister John Howard, fueled by his enduring interest in stoking the "history wars", reignited the discussion of a national curriculum for History (Taylor, 2010). Upon Howard's defeat in the 2007 federal election, the Rudd Labor Government quickly established the beginnings of what was to become the Australian Curriculum, as part of their *Education Revolution* platform (Commonwealth of Australia, 2008) starting with the four "core" subjects of English, Mathematics, Science and History for Kindergarten to Year 10.

Despite the relative breadth of the national curriculum, however (which has now been expanded to include eight learning areas including the arts, languages, technologies, and health and physical education), NAPLAN, introduced in 2009, has focused exclusively on literacy and numeracy. While NAPLAN, and the associated MySchool website, will be further discussed below in relation to test-based accountability, together with the Australian Curriculum they have worked to shape the practice landscape of teaching such that increased focus is placed on literacy and numeracy in many schools, to the detriment of other learning areas (Polesel et al., 2014).

Furthermore, this increased focus has seen a continuing discussion and at times toxic debate around the teaching of reading in Australian schools and particularly the essential or non-essential role of synthetic phonics. While the "phonics debate" in Australia dates to at least the early 2000s (Snyder, 2008), in recent years, due partly to the attention paid in reviews such as the TEMAG review, these debates have once again taken center stage, with phonics explicitly named as prescribed content in initial teacher education programs. As a consequence of the post-TEMAG reforms, the Australian Institute for Teaching and School Leadership (AITSL) is required to report annually to the Education Council on (among five other things) "implementation progress on accreditation requirements related to reading instruction, including phonics" (AITSL, 2015, p. 30).

The final piece of the policy ensemble demonstrating this increased focus on literacy and numeracy is also a consequence of the post-TEMAG reforms, and relates to the personal literacy and numeracy knowledge of pre-service and early career teachers. The Literacy and Numeracy Test for Initial Teacher Education (LANTITE) has been administered since 2016 in an attempt to improve "pre-service teacher selection" (Craven et al., 2015), a consequence of the TEMAG recommendation that such a test should be implemented to ensure that graduating teachers are "within the top 30% of the population in personal literacy and numeracy" (p. 17). While the LANTITE test does not relate directly to the focus on literacy and numeracy in the school curriculum, it has played an important part in denoting "what matters" for pre-service teachers and their education (Barnes and Cross, 2021) and, we argue, has contributed to the shaping of the practice landscape on which early career teachers enter the profession.

Corporate models of change

Associated with the GERM are models of new public management which devolve responsibility for things such as schooling outcomes while simultaneously requiring heightened control at the center of the system. In Australia, as elsewhere in the world, this has manifested via reforms described as aiming to increase school "autonomy". Such reforms—occurring in various forms across the country, most notably the Independent Public School scheme—have been argued to both support and detract from social justice outcomes, enabling greater flexibility at the local level but, in doing so, also entailing the potential to privilege some voices over others through cultural-discursive performative logics (Keddie, 2017). Such reforms have had considerable impacts on the nature and scale of principals' work and workload (McGrath-Champ et al., 2019). In addition, research suggests that there have been particular effects on teachers of such reforms, with reports of increasing amounts of paperwork since devolutionary measures have been put into place (Fitzgerald et al., 2019; Stacey et al., 2020). This has included paperwork in relation to the monitoring of student achievement, particularly in numeric terms; what is sometimes described as the "datafication" of schooling (Hardy and Lewis, 2017),

reflecting shifting social-political arrangements with material-economic effects for teachers. Such collection and documentation is also part of monitoring oneself as a teacher, as cultural-discursive evidence of "good teaching" (Mockler and Stacey, 2021).

Part of this perceived increase in "paperwork" demands comes from the institution of teaching standards (Australian Institute for Teaching and School Leadership, 2011). The standards sit as a social-political and cultural-discursive umbrella technology under which other policy processes operate, including accreditation and the Performance and Development Framework, a process by which teachers set goals and are assessed as to their achievement of them, aligned with the Standards (Australian Institute for Teaching and School Leadership, 2012). Thus these shifts also have clear material-economic effects for teachers because, as with the Performance and Development Framework, the Standards are now linked to teachers' remuneration; in the state of NSW, for instance, teacher salaries now progress not only in relation to time in the profession but also level of accreditation. For some teachers, the accreditation process has largely been seen as "hoop jumping" (McGrath-Champ et al., 2020); it is not so much the Standards themselves that have been at issue but rather the requirement to document the ways in which one's work meets such standards, constituting what has been described as "evidence for no one" (Talbot, 2016). In this way, teaching standards and the associated accreditation procedure can be understood as a manifestation of the shifting social-political relation of teachers' work with the state, that also arguably has cultural-discursive effects of enhancing teachers' performative subjectivities.

Test-based accountability

Finally, test-based accountability realized through standardized testing in Australia as elsewhere, has had a symbiotic relationship with both the standardization of teaching and learning and an increased focus on "core" subjects. Test-based accountability, as a form of "performative accountability" (Lyotard, 1984) resonates with the "audit explosion" (Power, 2003) in schools and school systems and, through the reshaping of the practice landscape of schooling, has given rise to a range of "perverse effects" for teachers, schools and school systems (Lingard and Sellar, 2013).

As noted above, Australia's national standardized testing program for school students was introduced in 2009, a key tenet in the Rudd-Gillard push toward the increased influence of the Commonwealth Government on schooling in Australia (Savage, 2016). Australian schools were at that point no stranger to standardized testing: state and territory-based standardized tests had been undertaken by students since the mid-1990s after the Commonwealth Education Minister managed to get agreement through the intergovernmental education council, using the lure of extra funding as a "sweetener" (Lingard, 1998). However, the new national testing regime, linked in 2010 to the Commonwealth Government's new national reporting website, myschool.edu.au, quickly became high-stakes (Lingard, 2010), through the publication of school results, along with the comparison of "statistically similar" schools enabled, and indeed encouraged by the website.

Research over the past decade has indicated that the impacts of the NAPLAN/MySchool ensemble are far-reaching. A narrowing of the curriculum (Thompson, 2013), increased "teaching to the test" (Dulfer et al., 2012), raised student and teacher anxiety (Howell, 2017) and an orientation to "gaming the system" (Thompson and Cook, 2014) have all been observed as examples of "perverse effects". Other research (e.g., Gannon, 2012; Mockler, 2013, 2016) has pointed to the systemic effects of NAPLAN in terms of reshaping perceptions of teachers and schooling in the public space.

Such has been the embrace of test-based accountability in Australia that the first Commonwealth Education Act, passed into legislation in 2013, included a commitment "for Australia to be placed, by 2025, in the top 5 highest performing countries based on the performance of school students in reading, mathematics and science" ("Australian Education Act" 2013, p. 3), as measured via PISA, TIMSS and PIRLS results. This clause was removed from the Preamble of the Act when it was modified in 2018, presumably on the basis of the increasingly gloomy prospect of its aim being met.

Despite its removal, however, Australia's commitment to test-based accountability shows no signs of abating: Australia's ever-more disappointing PISA performance is an entrenched part of the ongoing rationale for education reforms invariably involving increased accountability (see, e.g., Gonski et al., 2018, p. 2). Indeed, both the "formative assessment tool" embedded in the Gonski 2.0 reforms and the LANTITE test, one of the TEMAG reforms promoted as "encouraging" in *Through Growth to Achievement* (Gonski et al., 2018, p. 72) can be viewed as new iterations of test-based accountability impacting on the practice landscapes and practice traditions at work in Australian schooling.

The GERM and policy effects: reshaping the practice architectures of teachers' work

Research over the past ten years has consistently shown that the "policy effects" (Ball, 1993) of the GERM-related policy ensemble in Australia have been far-reaching, impacting upon the work of teachers, students and school and system leaders. It is important to note in this discussion, however, that the "field" or "practice landscape" (Kemmis et al., 2014) of school education in Australia is a very complex one, comprising hugely diverse schools across eight states and territories. Accordingly, we do not suggest that the policy effects of the GERM are experienced or impact practice consistently across the field. Indeed, even in schools that "on paper" might appear to be similar, a confluence of circumstances, including the particular articulation of "practice traditions" (Kemmis et al., 2014) within each context might mean that the effects play out in very different ways. Here, we explore policy effects in the form of shifts in the cultural-discursive, material-economic and social-political arrangements that frame teaching and schooling practices, and how research has suggested these have impacted some teachers and schools, without generalizing to the entire field.

To do this, we draw on, and draw together, key examples from the previous sections exploring the articulation of the GERM in Australian education policy and discuss these as particular cultural-discursive, material-economic and social-political arrangements, highlighting the significance of each set of arrangements for teachers' work as we go.

Cultural-discursive arrangements

The "language of improvement and reform" (Mockler and Groundwater-Smith, 2018) in education embedded strongly in policies related to the GERM, has infiltrated and come to dominate many of the cultural-discursive arrangements that frame teaching practice in contemporary Australia. The "consumerization" and marketization of education resonant with the growth in competition and "school choice" and the adoption of corporate models of change has seen a cultural-discursive shift from notions of collaboration and collectivism to competition—between students, teachers, schools, school systems—and a growing fixation on rankings, both national and international. At scale, there has been a linking of education processes with the economic advance of the nation, discursively shifting the purpose and goal of teachers' labor.

The NAPLAN/MySchool policy ensemble has seen notions of competition become embedded and intertwined with public understandings of what it is to be a successful school, demonstrated by outperforming other "statistically similar" schools. At the same time, the emergence of PISA as key arbiter of educational effectiveness on an international scale (Gorur and Wu, 2015), and the consequent ranking of national and regional schooling systems has also contributed to public understandings of education as a "global race" (Baroutsis and Lingard, 2016). Finally, the language of audit and new public management has over the past two decades permeated educational spaces, fueled by reforms related to corporate models of change, test-based accountability and the discourse of competition, reminiscent of Wendy Brown's observation that neoliberalism, "configures all aspects of existence in economic terms" (2015, p. 17), therein undermining and "undoing" social and democratic institutions.

The consequences of these cultural-discursive shifts for teachers are far from semantic, and neither have they been fully revealed as yet. While a substantial amount of research has centered on the direct impact of NAPLAN, for example, on curricular and pedagogical practice (Hardy, 2014; Polesel et al., 2014; Thompson, 2013), or on the impact of professional teaching standards on teachers' work and practice (Ryan and Bourke, 2013, 2018; Talbot, 2016), cultural-discursive shifts and their impacts are more complex and likely to be more observable over time than these more direct impacts. The language of new public management has contributed to the commodification of education (school and otherwise) in Australia. The dominant metaphor embedded in many policy documents and media reports on education of the "race", comprising "winners" and "losers", and the language of educational effectiveness which imbues schooling policy at every level are products of the neoliberal turn in education that contribute to these cultural-discursive arrangements.

Material-economic arrangements

The neoliberal turn has also served to re-shape material-economic arrangements in education. Logics in support of the individual right to "choose" have and continue to impact the allocation of funding for schools, across both public and private sectors. Although this is purportedly designed around "needs-based" principles, the current model reportedly continues to fail to meet this stated goal (see e.g., Ting et al., 2019), indicating the persistent tension between the funding of fee-charging schools and the achievement of system-wide equity. A core implication of these material arrangements has been the disproportionate sorting of student bodies into particular schools along socio-economic lines, arguably a result of the ongoing encouragement of school choice practices (Campbell et al., 2009).

Material shifts have also been evident in relation to what is taught and how, as well as who. There are new curriculum documents in play, and new, and very real, regular standardized testing experiences taking place. An emphasis on the standardization of teaching and learning has changed the arrangements for "who" can enter initial teacher education, altering the material future of the teacher education space, with the increased focus on "core" subjects also impacting what initial teacher education students do once there, for instance via the phonics debate. Teachers who graduate will also encounter a new pay scale, at least within the public sector, tied to accreditation processes. It is thus clear that the GERM has not only resulted in shifting arrangements for how teachers think and speak, but also what they "do"—and how they are remunerated.

According to the research literature, shifting arrangements governing what teachers "do" are reported to have a range of fairly direct impacts (notably including the pay they receive), as well as less direct implications. Working with qualitatively different student cohorts involves different kinds of work for teachers (Stacey, 2020). In addition, school choice has been argued to impact where teachers can and will work (Parding et al., 2017). Enhanced accountability practices have also been seen to lead to an increase in "paperwork" and overall workload for teachers (Stacey et al., 2020). Thus the effects of the material-economic arrangements for teaching work under the GERM have in many ways been immediate. Like the impact of cultural-discursive arrangements, however, if left unchecked, these material-economic shifts are likely to have further impacts in future.

Social-political arrangements

Social-political arrangements concern matters of power—the relationships between people and within systems. Drives toward competition and choice change the power dynamic in and around schools, positioning teachers as service providers, with parents

as "customers" and students as "products"; a "transaction". Schools are placed in competition with each other, as the emphasis is placed on working in the interest of oneself—or one's school—rather than in the interest of the collective. While schools and teachers may wish, and indeed even act to resist this relation, they are unavoidably implicated within new market systems by virtue of the arrangements governing funding and student enrollment.

In addition, the current settlement positions schools and teachers as instruments of the state working toward economic advancement, rather than focusing on working with and within local communities. In being so positioned, these local actors are also responsibilized. This does not however mean they necessarily have greater control or autonomy in their work, but that the expectations of their responsibility for its outcomes are increased via corporate models of change. Responsibility is shifted to local levels, and balanced by enhanced accountability at the center, seen for instance through the technology of standardized testing. Corporate models of change also involve a re-arrangement of power relations within schools, due to the enhanced role of principals in matters such as staffing.

There is then, in the era of the GERM, an evident reconfiguration of the role of the teacher, with a shifting relationship between teachers and other school staff, and between teachers and their work. Research has noted a range of impacts of these changes in social-political arrangements. One impact of positioning students and parents as products and customers has been new forms of labor related to marketing and market positioning, evident in some schools more than others but a relevant concern across the board (Stacey, 2020). Meanwhile, a lack of incentive to work collaboratively across schools has been argued to be fragmenting the "social" in the system (Holloway and Keddle, 2019), while teacher and executive relationships are put under strain in the context of devolutionary governance. In such an environment, teachers are also potentially tempted to work toward more simplified, countable goals rather than more holistic ideals of equity and student wellbeing (Wilkins et al., 2020). In addition, having to engage with standardized testing and "what works" approaches, and the workload impacts of having to "prove" oneself and one's work (Stacey et al., 2020), reflect the ongoing positioning of teachers as subservient to the state through these revised power relations. It is thus clear that GERM has impacted not only how teachers think and speak, and what they "do", but also how they are positioned within hierarchies of power, from the context of the school to that of the nation.

Conclusion

In this article, we have presented the case of Australia as a national example of the global educational reform movement, or GERM, currently in operation in various forms around the world. We have highlighted the significance of teachers to this project, as responsibility for schooling outcomes is shifted to local levels including that of the teacher, entailing substantial reform that directly targets what they do, as well as how this work is positioned, encoded and recognized. However, we have also emphasized that many of the impacts of the GERM upon teachers' work come from policies which do not directly target teachers. This includes, for instance, drives toward school choice, and the reshaping of the role of principal under devolved models of governance. Nevertheless, as we have argued, these changes have impacts for teachers, affecting such things as the composition of their classrooms and their relationships with school executive, respectively. Education reform, we argue, must therefore always be considered as part of a complex system with far-reaching and indirect, and unintended as well as intended, effects. Our focus on teachers in this article serves to highlight this core tenet in approaching the analysis of policy settlements, in education and beyond.

The analysis presented in this article may strike the reader as somewhat bleak. Teachers are seen as subject to cultural-discursive, material-economic and social-political arrangements which are largely constraining: heightening responsibility for narrowly defined educational outcomes, yet simultaneously curtailing autonomy; increasing the segregation of students, yet without providing appropriate resourcing, material or otherwise; and throughout, introducing new competitive and performative tensions at classroom, school and state levels. This is at least in part the result, we argue, of the GERM, which sees the individual and the economy driving educational imperatives rather than, perhaps, more communitarian ideals.

There is some evidence that broader conversations about education may be shifting at the global level, however. Zancajo (2019) identifies an "equity turn" in global education policy, and evident in current Chilean reforms to school choice policy via the "Inclusion Law" and requirements for (some) schools to enroll a greater "social mix". Others, however, are less optimistic. Research based on North American data, for instance, has suggested that within the current environment, teachers may be becoming wholly "marketized, managed, and performative" (Holloway and Brass, 2018, p. 12), part of an ongoing shift in the nature of teachers' work in recent years. Similarly, a recent Australian publication documents the rise of the "neo-performative" teacher, whose work is aimed at narrowly-defined equity purposes of "standards" and "outcomes" of academic attainment, rather than "a broader"—and perhaps more subversive—"social justice agenda" (Wilkins et al., 2020, p. 4). A growing global focus on equity, however defined, may nevertheless constitute a move in the right direction, and may offer some hope, especially if supported by key national and global institutional bodies. In addition, our own recent research suggests that Australian teachers are somewhat wise to the landscape they have seen shifting underneath their feet, expressing some distrust and resistance toward the datafication of their work and its associated performative imperatives (Mockler and Stacey, 2021; Stacey et al., 2020). This would suggest that the trajectory of education reform over the past forty to fifty years may yet change course. An "equity turn", combined with ongoing teacher discernment and criticality, may be key ingredients in enabling a shift in the Australian education policy settlement, toward an appropriately supported, empowered and respected teaching profession.

Not only do we have to defend ourselves, not only affirm ourselves, as an identity, but as a creative force.

(Foucault, 1997a, p. 164).

Introduction

In this article we consider the current state of teacher professionalism in the neoliberalized context of 21st century education, characterized by intensified cultures of competitive performativity. As part of our discussion, we draw on interview data from early career teachers working in academies in the north of England, setting these alongside Foucault's thinking on friendship as a way of life, in order to explore how teachers' relationships to their professional work, to their colleagues and to themselves might be conceived and enacted otherwise.

Schools today, operating within the mantra of global economic competitiveness in many national contexts, function within a neoliberal policy environment that has been significantly re-shaped by a range of factors. These factors include the deregulation and privatization of school governance, increasing curricular prescription, the power of high-stakes assessment, growing popularity of authoritarian approaches to discipline, the intensification of competitive pressures within and between schools, and the rise of alternative routes into teaching. A key instrument of these reforms has been the "new professionalism" (Phillips and Furlong, 2002), characterized by governments' attempts to address alleged problems of teacher quality, attrition and retention; to differentiate the profession in terms of tasks and rewards through chartered teacher schemes; to assert a coherent, evidence-based knowledge for teachers; and to remedy teachers' perceived lack of accountability (Furlong, 2008). The proclaimed goal of the "new professionalism" has been to offset the otherwise "mystificatory and self-serving ideologies" (Gilbert, 2014, p. 44)—an autonomous teaching subject with responsibility for the public good and whose competence and conduct could be harnessed to political ends (Fournier, 1999)—reminiscent of the earlier liberal form.

Whatever the ideology governing bodies such as the state can only manage identifiable subjects. Educational policy relies on and operates through a politics of teacher identity (Clarke, 2009; Day et al., 2005; Mockler, 2011). Within the regime of "new professionalism," "policy discourse constitutes the practice of teaching as the ground of student achievement, an objective ground that justifies the normative arranging and ordering of teachers" (Carusi, 2017, p. 638). As such, the teacher becomes indistinguishable from the law (i.e., teaching standards; evidence-based practice; effectiveness) and its desired results—the extraction of the educational life of the young as human capital in the interests of global capitalism—the teacher's life and the law become one; the teacher is her effects (Lewis, 2015). Policy—formation, implementation, enactment, and dispersion—foment the idea that effective teachers are "what leads to student achievement and what student achievement reveals" (Carusi, 2017, pp. 638–639). Education is reduced to a project of calculation—a strategy for realizing predetermined ends (i.e., high test scores)—with little intrinsic value (Biesta, 2010; Pinar, 2006; Taubman, 2009). Students and parents are seduced with cruelly optimistic promises of success, "a cure of sorts to a politics of fear and exclusion" (Roach, 2012, p. 166). Similarly deceived by the promise of and desire for certainty, and often fearing for their own job prospects, teachers side-line their moral judgment about what matters educationally. The ethico-political dimension of teaching is disavowed (Clarke and Phelan, 2017).

It is not unreasonable that teachers might adopt a "stable and positive [professional] identity obtained through identification with an existing socio-political order" (Biesta, 2011, p. 145; see also Day et al., 2006). However, recognition is always ambivalent, bearing both the promise of one's independence while highlighting one's reliance on the other for acknowledging

that so-called independent state (Butler, 1997). Asserting that everything—from high achievement on national and international tests to economic happiness—depends on the teacher paves the way for the standardization of teaching and teacher education and development (Larsen, 2010). The intellectual—the teacher and not the student is the site of education—and political—the teacher is scapegoated for the failures of the system—traps for teachers are lethal (Pinar, 2006). In the USA, teachers deemed ineffective are quickly taken out of the classroom, livelihoods threatened, teachers' credibility obliterated, and professional judgment erased (Lewis, 2015). In the UK "experienced teachers who have vocationally, ethically and professionally based identities" (Courtney and Gunter, 2015, p. 414) and who resist the reduction of their work to "effects", are "purged" from the workforce in favor of younger practitioners who see teaching as "just a job" and are more inclined to accept the "dominant discourses of audit, performativity and standards" (p. 414). We are witnessing a model of power that constructs the teaching subject through rejection, disqualification and exclusion by imposing a monoculture of thought and practice (Clarke and Phelan, 2017). The upshot is an educational policy context that privileges teacher compliance and conformity, while restricting their creativity and criticality. As such "teaching as a form of life-practice" (Smith, 2000, p. 16) wherein teachers are charged with the pursuit and sharing of truth with colleagues and students—what Britzman (2009) refers to as "the very thought of education"—is endangered.

Deeply concerned about the current politics of teacher identity, the central organizing questions for this chapter are: *What impact does a politics of identity—effective teacher—have on the professional lives of teachers? What constitutes an ethico-political response to the normative order of effective teaching, and with what consequences?*

We begin by illustrating the exclusionary, inequitable and "vicious hierarchies of identitarian difference" (Roach, 2012, p. 131) undergirding neo-liberal policy and playing havoc with teachers' professional lives. The site of exploration is the English academy schools where, one could argue, we find the most extreme form of neo-liberal schooling and a normalizing politics of identity—effective teacher—at full throttle. We then consider Foucault's challenge to disengage from a politics of identity—to dis-identify—by adopting an ethics of friendship. As a form of relation that transcends the confines of codified (professional) obligations and duties, friendship can play a significant role in re-figuring institutional norms and generating new practices of living together in schools (McLaren, 2007). We explore how three curious aspects of Foucauldian friendship—betrayal, distancing, and frankness—might generate non-normalizing relations that surpass institutional utility and pre-determined teacher identity. We conclude by positing a negative ethics of friendship for teaching in our times.

Engaging a politics of identity: toxic teaching in England's academy schools

We should fight against the impoverishment of the relational fabric.

(Foucault, *Essential*, VI: Ethics 158).

England has been in the vanguard of education developments based on a politics of (teacher) identity, borrowing and adapting policies and practices from other global contributors to the ever-evolving neoliberal playbook. Its national curriculum is highly prescriptive, while the combination of high stakes assessments, league tables and a punitive inspection regime triangulate to ensure a maximum degree of compliance on the part of schools, educators, parents and pupils. Since the 2010 Academies act in the UK, 77% of Secondary Schools have become academies (Department for Education, 2020), schools that are state funded but outside local government control, instead having direct responsibility to the Secretary of State for Education. Drawing inspiration from international models including Swedish Free Schools and the US Charter School movement, and inflected with a powerful dose of neo-colonial nostalgia (Clarke and Mills, 2021; Shahjahan, 2011), this program of academization has served to install a highly "unpublic", quasi-privatized form of public education in England (Thomson, 2019).

Our discussion below draws on interviews with a number of early career teachers with experience of working in academies in the North of England. Telephone interviews of 1 hour duration sought, through narrative inquiry, to establish teachers' perspectives on matters of policy, professionalism, and professional relationships. The participants taught at a number of different secondary schools serving students between eleven to sixteen years of age, from socioeconomically disadvantaged communities; the majority of these schools had been forced into academy status following poor inspection outcomes. Reflecting a pattern found in England but also in other international contexts, such as the USA, many schools serving such communities frequently employ an educational model that is grounded in demands for strict compliance with detailed curricular and pedagogical requirements and with highly specified and prescriptive disciplinary codes.

Such attention to the micro-details of institutional life has significant implications, not only for the students attending such schools but, for the teachers who work in them and who are required to promote, monitor and enforce the codes as part of their professional practice. Within such cultures, what counts as legitimate knowledge and understanding, what is required in relation to the micro-details of appearance, behavior and comportment, as well as what is expected to comprise the content of each person's thoughts and beliefs, are all specified, shared and sacrosanct. In other words, such cultures have implications at multiple levels including knowledge, interpersonal relations and individual subjectivity.

In thinking about these implications for teachers' professional lives, Foucault's notion of the possibility of conducting a historical ontology of the self is particularly valuable, since it allows us to bring together the pedagogical, political and ethical aspects of teaching as a socially situated and culturally constructed practice. Specifically, we base the following discussion on Foucault's (1983, p. 237) argument that we can conduct such an ontological inquiry on three domains:

First, an historical ontology of ourselves in relation to truth through which we constitute ourselves as subjects of knowledge; second an historical ontology of ourselves in relation to a field of power through which we constitute ourselves as subjects acting on others; third an historical ontology in relation to ethics through which we constitute ourselves as moral agents.

(Foucault, 1983, p. 237).

These three domains of historical ontology, i.e., knowledge and truth; power relations; and ethics as a practice of self-formation, provide the structure within which we present the analysis of our data from interviews with early career teachers. Specifically, we consider the domain of knowledge and truth in terms of teachers' relationships to curriculum, pedagogy and assessment; we examine the domain of power relations in terms of teachers' relationships with school leadership and colleagues; and we consider the domain of ethics in terms of teachers' understanding of and relationship to themselves. For analytical purposes, we begin with the first domain, while mindful that in practice the three domains are often inextricably entwined. For each domain, we illustrate the assimilationist, exclusionary, and hierarchical qualities of identitarian politics and policies in play—teachers' experience of subjection, and their struggles for subjectivation, as they encounter the politically administered identity of "effective teacher."

Teachers' relationships to curriculum and pedagogy

Common to the experience of many of the teachers we interviewed in our study were strict requirements to teach particular content in very specific ways. As Emma put it, "there were a lot of non-negotiables that you had to make sure were implemented in your lessons ... it was very much like, you had to do these things. Some of them were behavioral, some of them teaching". As Emma notes here, concerns about curriculum and pedagogy in the schools our interviewees worked in typically went hand in hand with highly specified behavioral codes. Such requirements reflect a belief that consistency is the key to both effective teaching and school improvement.

As Miranda explained:

It's about consistency. And that comes out of a real lack of consistency in the school's history. They were a failing school ... an inadequate school, for many years and nobody wanted to go there. And now, they've had this huge success, become a good school, and with that it's like, we've got to be consistent, we've got to be consistent. So, I think that's part of the reason it's so prescribed.

Just as staff were expected to ensure consistency in their supervision of children's learning and behavior, so too the teachers themselves were continuously monitored and surveilled to make sure they were teaching in the prescribed fashion. Yet the purposes of particular observations were often not shared with those being observed: They did a lot of unannounced drop ins constantly but they never told you what they were looking for or what you were being graded against or marked against so you always came away with some "not met" somewhere. Sarah's experiences were similar to those described by Miranda who gave a chilling account of never knowing where the monitorial gaze would fall and the consequences this could have if her pedagogical practice was found to fall short of expectations: "just picking up a book ... and if they're out of cycle – which is about a three-week cycle – that's not good enough". Miranda's reference to a three-week cycle highlights the quantifiable, and hence controllable, dimension of marking which helps explain why it was such a focus for pedagogical guidelines and requirements; yet, as the teachers' comments also imply, it is an overly simplistic and reductive proxy for good teaching and learning.

For a number of teachers in the study, such practices served to undermine their professional aspirations: "So, they have someone really controlling the curriculum in that sense, and then I just make a PowerPoint." Jackie described a similar "tick box" response to the pedagogical and professional culture in her school: "she'll want to see very much in the way of direct instruction. If I know someone's coming in, or if they pop in randomly, I will just try and figure out what they want, and make sure I tick that box." Perhaps unsurprisingly, this highly prescriptive, "teacher proof" approach to teaching, by underestimating the ability of the teachers, often undermined its own aims as Henry admits: "I know I've got to do it, so I just do it ... it does make me detest the task ... which then makes me cut corners, which makes it less effective, because I might not be marking it as precisely, or as accurately, as I would do otherwise." The effect of the school policy environment in terms of undermining teacher professionalism was evident in other comments, for example, in Miranda's comments in response to an invitation to share her thoughts on potential alternative feedback and assessment practices: "You know, I haven't even thought. I think I'd like to just trial some other ways of giving feedback ... I haven't really looked into much research around marking feedback". This de-professionalization was characterized by Sarah as a loss of professional voice: "What I would call draconian measures

about marking and lesson planning. And then we had no voice about that. So then, I think our relationship with senior leaders became a bit more strange because we didn't agree with what they were doing but it was like this is what we are doing so you have to live with it or you leave".

Teachers' relation to the work of curriculum, pedagogy and assessment is that of compliance, of blind loyalty to externally imposed mandates. When school improvement and student success are conflated with consistency of curriculum content and processes across teachers at the same grade level, to think and act otherwise constitutes a betrayal of one's students, colleagues and school leadership.

Teachers' relationships with leadership and colleagues

As others have noted (e.g., Courtney and Gunter, 2015), many English schools are pursuing a reform agenda that clearly conveys a zero-sum, take it or leave it message to staff (and students) in relation to various aspects of school policy. This was captured in Emma's reflections on the leadership in her school: "We had a caretaker head teacher or two, and then there was all this consultation, which was really just consultation by name. The trust were coming in and telling people how it was going to be. There were quite a few of those meetings, and it was interesting, because I think the phrase was "you either get on the bus, or you get off". Such slogans serve to close down discussion, providing no space for teachers to contribute to policy or to engage in professional debate and deliberation. Instead, they position teachers as mere minions implementing and adhering to the letter of policies that are decided "higher up". Indeed, Sarah used the word "minion" to describe the position of teachers in typical English school management systems as she explained the frosty reception she received when trying to contribute to policy discussions: "I offer opinions and a different opposing view and see things and I don't think they like that. I think they are not expecting that because I am just a teacher, I am not a leader in terms of management. I suppose as a teacher you are, you're just a minion really to senior leaders sometimes."

The phrase, "just a teacher", is telling, capturing the diminishment of teachers' professional agency and identities. It also suggests an expendability. This is a point noted by Courtney and Gunter (2015) and also highlighted by many of the teachers we interviewed. As Miranda observed, "If he doesn't like you, then you won't have a job. And it'll be done well enough above board and everything, but people come and go very quickly if their face doesn't fit." Olivia reported remarks made by members of her school leadership team that "no one is irreplaceable". Similarly, Sarah explained how a culture of fear and anxiety ensured compliance: "There was the fear that if you didn't meet those deadlines and targets, what would happen? Would you get sacked? Would you be put on competency?" Ensuring that non-compliant teachers could be removed and replaced quickly, easily and efficiently required that professional unions had no role in schools. As Evan put it, "You know, union's a dirty word. If you mention the union, it's just not a thing ... it's just not there".

The undermining of solidarity represented by the proscribing of unions had effects on the teachers' professional relationships with each other. Sarah described how her peers reacted to a sense that she was not one of the "in crowd" as far as management were concerned: "I think they saw me as kind of like a weak element and therefore they didn't want to be associated with a weak element so they kept away from me. They saw like I wasn't getting on with the line managers ... so they distanced themselves and kind of allied themselves more with the popular teachers". Such competitive and threatening school environments also undermined collaboration, as Jackie noted: "It's a culture of competition, and alienation. It's sink or swim, people will not give you their stuff, people will not share". Alienating teachers may not promote collaboration - or stimulate creativity and criticality - but it is a powerful tool of control.

The control of practice and the diminishment of teachers' professional agency went all the way down to relatively trivial matters like the details of dress. Exemplifying Foucault's insights regarding how power is exercised on the body, and through the micro dimensions of practice, Miranda noted the attention to detail:

Yeah, they're just very detailed again, much like the kids' uniform policy. Staff uniform is you've got to either wear a, for females anyway, a skirt obviously, on the knee. No elbows can be on show at any time. So, all your tops have to be longer than elbows, or you wear your jacket all day, basically ... They say jackets can be a pinstripe, or any professional check, but I couldn't wear a floral jacket, for example, or I couldn't wear a jazzy jacket.

Unsurprisingly, the effect of these controlling practices went beyond diminishing professional agency and contributed to a sense of alienation, where, as Miranda observes, teachers no longer recognized, and felt estranged from, themselves: "Really you know that something's not quite right, but you can't. It's so strange. Nobody says no, even though you think, in real life, you would say no, and people should say no. But nobody says no". The sense of alienation was reflected in the comparisons some of the teachers grasped for to capture their experience, as in the following remarks from Emma: "It felt like Big Brother. There are a lot of in-jokes among some of us, about it being like the Soviet Union". Miranda described the effect of the constant monitoring in a similar way: "There's that fear of big brother's watching you, for want of a better kind of phrase".

The normalizing gaze of colleagues and school leaders fostered a community of restrictive, conditional belonging (Roach, 2012) wherein teachers' sense of self was rendered fragile, fearful and manipulable. Autonomous judgment, which requires both close engagement with and distance from the ideas of others, was always in danger of being mis-read as non-compliance.

Teachers' understanding of and relationship to themselves

The policies and practices operating in the schools in which the teachers worked had a powerful effect on their sense of themselves. This sometimes reflected a deliberate intention to remould teachers' subjectivities. Sarah goes on to explain that, in her first year, she was told "we'll break you down, and we'll rebuild you". Part of this metaphorical process of "breaking you down" and "rebuilding you" involved creating subjects who internalize the external monitoring and surveillance and continuously monitor their own performance "because that is always there in the background, which I think fuels your self-motivation as well. 'What are the consequences of not doing this?'" Another violent metaphor was used by Sarah later on in the interview to describe the devastating emotional impact her experiences had on her confidence and, indeed, her whole sense of herself.

It actually destroyed me emotionally for quite some time. I actually thought, I can't teach, "I can't teach, I can't do this", and I was just distraught that five years of my life, and everything I'd worked so hard for was just destroyed just like that.

Like Sarah, Evan felt that the heavy scrutiny he experienced as a new member of staff had a significant impact on his emotional state and his sense of self: "I have, for the first time, experienced stress and anxiety. I think there are just things, language they use, and the way they kind of do things, it just keeps you on edge. I don't feel comfortable". Anxiety was something foregrounded by other teachers as well. For instance, Miranda linked anxiety to the long-term impact of the culture of monitoring and surveillance in her school: "I just feel very anxious around ... if someone's going to come in ... what's going to happen as a result of that. That was terrible ... and I think it leads you to a lot of second guessing, reflecting". For Jackie, a sense of anxiety and unease inhibited her professional creativity and led, as was no doubt intended, to compliance and conformity: "Wary ... I don't want to step a toe out of line. I'm very much always thinking about how I can make sure that everything is just spot on". For all these teachers a pervasive anxiety curtailed their professional growth, while having a corrosive effect on their mental wellbeing.

For others, such as Emma, it was the experience of being reprimanded for exercising agency and initiative that impacted most on their subjectivity: "I'm literally just coming in and doing what I'm told. I'm not engaging with this. I'm not allowing myself to emotionally invest in this, or mentally give my cognitive energy to this anymore. I'm just literally an automaton, and that, I think, sums it up". Ironically, after adopting this automaton state, Emma was "lauded" as an exemplary middle leader in the school by her manager. Like the workers in Fritz Lang's (1927) dystopian film, *Metropolis*, these eager and enthusiastic young teachers have been reduced to robotic cogs in an uncaring and instrumental performative machine.

When asked "what needs to change in teaching?", the teachers interviewed were unanimous despite their varied experiences. Common to all was the sense that teachers need to be trusted and to be granted greater agency in their work, as Emma explains:

There has got to be a sense of like, if I'm going to go back, I want to be clear I'm going to have a voice, because I've always been proud of the voice that I have [F]undamentally, there needs to be trust in the profession, and that runs from ... the Government need to trust the people in the profession, senior leaders need to trust their teachers, and so on and so forth.

Thus, it is precisely the lack of trust in teachers' voices, within multi-academy "trusts", which has undermined their relationships with pedagogy, compromised their relationship with leadership and, ultimately, eroded their professional self-concept. The gradual dismantling of teachers' confidence in their ability to think, make good judgments, and act in the best interests of students weakens teachers' ability to resist norms and to question their own or their colleagues' practices.

Our analysis of teachers' relations to their professional work, their colleagues and themselves highlights the destructiveness of a politics of identity in teaching in academy schools. Ironically, the sought after "effective teacher" in the academies is also expendable, interchangeable, and increasingly disengaged. We now turn to Foucault whose work invites us to consider friendship as a literal and metaphorical mode of being together in schools. We imagine non-normalizing relations to curriculum, colleagues and one-self—curiously wrought with betrayal, distance, and frankness—that Foucauldian friendship might offer teachers. Our intent is not to prescribe an alternative set of social relations in schools—a counter to what currently exists—but to acknowledge the possibility of a multiplicity of ethical relations and positions. Our project is about challenging the relational fabric of schools, without forming a program or agenda, by identifying the conditions for an experimental approach to relationships in "marginal spaces" (Kingston, 2009, p. 16) that are only minimally linked to the larger system.

Foucault's challenge: friendship as a form of life

The only acceptable motivation for following others into their worlds is friendship.

(Ellsworth, 1989, p. 317, fn 66).

Central to Foucault's work is the interest in overcoming "biopolitically administered identity at any cost, often without conscious knowledge of exactly why or of what lies beyond" (Roach, 2012, p. 130). In other words, he is interested in the politics of identity in

relation to various normative realms such as the law, health, gender and sexuality. In relation to the latter, rather than emphasize sexual desire as the basis of “an essential mode of being,” homosexuality is, for Foucault, a call to inventiveness and creativity; an opportunity to articulate a way of life beyond a politics of identity and “in the process multiply the ways one relates to others” (Albrecht-Crane, 2005, p. 429). Foucault offered the practice of friendship as a release from “the shackles of identity and interiority” (Roach, 2012, p. 5) and as such as a way of life.

A way of life can be shared among individuals of different age, status, and social activity. It can yield intense relations not resembling those that are institutionalized. It seems to me that a way of life can yield a culture and an ethics.

(Foucault, 1997a, p. 138).

Friendship, in this sense, is a form of localized resistance to institutional normalization, an affective relationship involving “the collaborative creation of new subjectivities and relationships as participants struggle to come to terms with one another” (Kingston, 2009, p. 9). Rather than falling back on social norms, Foucault’s concept of friendship privileges experimentation with many different kinds of relationships over traditional, institutional bonds. To suggest alternative relationships is not only to threaten the stability of normalizing and normalized relationships but also to threaten the social (and educational) order they support.

Foucault (1997a,b) was clear, therefore, that institutional relations such as family, profession and any kind of “obligatory camaraderie” (p. 136) has nothing to do with his concept of friendship. Institutional relations, in his view, are overly burdened by formalities that aim to establish and sustain prescribed roles, identities and outcomes and which rely on distancing authority. We would argue, however, that there is a need to mitigate “the dangers presented by the excessive and harmful normalization of relationships” wrought by institutional life (Kingston, 2009, p. 16). As the case of the English academy school has illustrated vividly, institutional life produces and reproduces hardened identities (e.g., “(in)effective teacher”) and “excessively rigid relationships” (e.g., teacher-principal hierarchy) and “perpetuate[s] practices that ought to be discarded” (e.g., high stakes testing and performance reviews) (p. 8). Friendship as a non-normalizing relationship might assuage those effects. This is not to say that friendships are devoid of power relations but that they may be “disconnected from the most totalizing and normalizing systems of power relations, and characterized instead by very dynamic and unstable systems of power relations” (Kingston, 2009, p. 8). The norms that apply may be fewer or of the kind that enable a temporary suspension of rules. As such, while institutional aims, norms and actions do not change drastically, friendship takes place apart from those aims and norms, “where context and chance constitute the ethical specifically because they are not *for* anything in particular” (Carusi, 2017, p. 644). This is not to say that friendship offers nothing: there is “a dynamic and dialectical interconnection between practices of the self and politics because one’s ability to resist normalization relies upon non-normalizing social relations” (McLaren, 2007, p. 196).

Yet Foucauldian friendship is anything but utopian. It is “founded in estrangement” and suspended between betrayal and loyalty, distance and closeness, brutal honesty (frankness) and sincere concern, the impersonal and the intimate (Roach, 2012, p. 7). Complicated affects—discomfort, frustration, love—are produced and impersonal ethics—nonrecognition, openness to alterity, respect for absolute difference—are encouraged. It is these curious, anti-social qualities of “friendship as shared estrangement” (p. 7)—and their a-subjective force—that create a surplus of affect uncontainable by institutional forms. In this excess lies the potential to imagine, to make, do, say, and think differently, calling into question understandings of a manipulable teacher identity characterized by blind loyalty, restrictive belonging, and compliant speech in the academy. Instead, Foucauldian friendship between and among teachers and school leaders invites betrayal, distancing, and frankness as tactics that work on, with and against the dominant school order. In the process teachers glimpse disidentification from the order of things.

Reconstituting a relation to curriculum, pedagogy and assessment via betrayal

Relations to knowledge inevitably shape teachers’ relation to the normalizing authority of the school as an institution (Castioradis, 1968). We have illustrated how steadfast adherence to a mandated curriculum, pedagogy and assessment defines teachers’ relationship to their professional work in the English academies. The fatalistic sense that “unless we do X, we will fall behind” (Smith, 2000, p. 18) and unless we do X within this time slot, destroys any particular, local relationship of the teacher (and ultimately the student) to knowledge and experience—as living practices of self- and social formation. The formulaic relation that does exist is non-negotiable, leading to either silent deference, on the one hand, or secret-keeping and fear of exposure, on the other.

Consistency, and the blind loyalty it requires, is at odds with thought. Thought requires betrayal—a form of indifference to norms and normalizing forces, if you will—one condition of Foucault’s concept of friendship. Unlike other relations such as marriage that constitute and are enacted in the private sphere, friendship is properly communal and signifies the common (Roach, 2012). Not to be confused with the “sameness” imposed on teachers in the academies by curriculum prescription and pedagogical predictability, the common is constituted in and as a space of movement, fluidity, and incoherence that “passes under the radar and off the grids of biopower” (Haver, Reading Foucault’s Genet Lectures, p. 7 in Roach, p. 146). At a tactical level, betrayal can be as simple as intermittently posing difficult questions or sharing an alternative point of view during a faculty meeting thereby diverting the school agenda. It might involve a teacher inviting school leaders into one’s classroom on occasion, rather than waiting for them to show up unannounced; and rather than accepting feedback on performance, manipulating those moments as opportunities for dialog about practice. Surprising a teaching colleague with an offer of collaboration can betray the competitive ethos of the school

temporarily. Small and seemingly insignificant acts of betrayal gradually dismantle the “architecture of fortification” (Foucault, 1988, p. 139) that the dominant school order seeks to maintain because there are no bannisters to support nor expectations to guide; each occasion for thought relies on openness to alterity and respect for difference (Roach, 2012).

Moreover, efforts to switch the register from compliance to conversation invite others to give up their grounding in any particular ideology—to disidentify from the school order temporarily—and to become a person who enters into “a movement of thought that is groundless” (Kaufman, 2001, p. 131).

These thinkers obey impersonal rules of hospitality—hospitality to the other as a form of thought and not as a person ... a new form of intellectual hospitality, a mode of being in common that is not a form of correcting or out-mastering the other, but rather a way of joining with the other in language or in thought so that what is created is a community of thought that knows no bounds, a hospitality that liquidates identity, a communism of the souls.

(Kaufman, 2001, p. 141).

Teachers engaging in “impersonal friendship that traverses thought” (Sellar, 2012, p. 71) experience the boundlessness of thought; they become “intoxicated,” “driven by curiosities that are closer to pleasure, to play and to wandering” (Arsenjuk and Koerner, 2009, p. 8), and infectious as they convey such curiosity to their students. Such engagement offers a temporary suspension of economic, social, cultural, religious or political forces pervading schools that otherwise wish to direct teachers.

For teachers engaged in dialog, “the world becomes something of a concern, something to think about [together], something that provokes ...” (Masschelein, 2011, p. 535); and, we would add, evokes a surplus of affect that cannot be contained by institutional forms and therein lies the potential to act, make, say and think differently. Teachers are reminded of their own desire to think and to care about their educational decisions. In the back and forth of dialog, for example, each interlocutor moves in and out of control of discourse. The identities and positions established and operating within and through institutional norms—experienced leader versus inexperienced neophyte, or, progressive versus reactionary—become disjoined and participants “produce new modes of being together” (Albrecht-Crane, 2005, p. 492). The preservation of one another’s perspectives—one another’s strangeness (otherwise annihilated through identification with the school’s singular ideology)—becomes paramount while one’s positional identity becomes ambiguous. This is because during dialog identity is not at stake, the world is.

The teacher as thinker has a relation to thought that is not reducible to the accumulation of information (the cumulative effect of power) or to the logic of (de)professionalization that governs the work of the English academy school. Teachers as thinkers betray their initial thinking; they have second thoughts about the tradition or ideology they have heretofore accepted. With non-reliance on identity (or ideology) there may be “a loss of self-assurance” (Sellar, 2012, p. 72) but the form of power at play is neither that which induces an ontological insecurity (Ball, 2003) nor evokes guilt, for being inconsistent with school policy. Rather the teacher is released from predetermined identification and association and invited to participate in creative and critical thinking with others.

Reconstituting non-hierarchical relationships with colleagues via distancing

Disciplinary power links the forces of hierarchical observation, normalizing judgment, and examination together to generate and sustain “the normal”—what is considered “effective.” In the English academy, disciplinary power is a crucial means of ensuring teachers’ compliance to the school dress code, pedagogical creed, and curriculum practices (Foucault, 1975). In the process not only is the “normal” teacher produced but the “abnormal” teacher—the one who does not “fit”—is easily identifiable, differentiated and excluded. Confessional in quality, hierarchical relations offer only conditional belonging, reflecting the power of the school leadership to withdraw their favor when the teacher fails to comply. Teacher autonomy is traded for a particular kind of belonging—a calculable love (Phelan and Vintimilla, 2020). To think for oneself, to offer an opposing view, or to practice in ways inconsistent with the school mandate is to experience the power of the leader who has the authority to establish blame and banish at will (Foucault, 1997a,b).

Friendship as shared estrangement can offer some respite from hierarchical power because it is not based on identity-based hierarchical divisions but suggests a way of life shared among individuals of different roles and statuses and so forth; involving “polymorphic, varied and individually modulated relationships” (Foucault, 1997a, p. 139). There is no getting away from power differentials in institutions but this is not to say that mutual trust is incompatible with unequal power. Perhaps this is so because friendship need not be “an ‘all or nothing’ relationship” (Sellar, 2012, p. 70). There may be some aspects that teachers and school leaders share—their interest in the well-being of students—but the enactment of that interest may vary. To share some sense of educational purpose can be a source of belonging for educators but this need not diminish nor erase teachers’ capacity to deliberate, to offer opposing views, to think and judge otherwise on occasion. The educational challenge is not to discover the truth in one’s teaching or leading, but rather to use both to arrive at “a multiplicity of truth-making relationships” (Albrecht-Crane, 2005, p. 493). If teachers are not to be simply objects of policy but advocates of education beyond specific institutional concerns, they have to engage in debate not only with one another (at grade, school, and district levels) but also with a range of professional others. Existing educationally as well as politically in this way demands that teachers are able to stand alone, together (Phelan, 2015).

As an ambivalent social relation, Foucauldian friendship offers the possibility of not belonging too much. As such, it “deliberatively avoids relationships that lead to attachment or possessiveness” (Roach, 2012, p. 146); friends reduce their reliance on recognition by others for a sense of their own competence and worth—a subtraction of power from one’s “destructive ego” (p. 146).

Preserving distance while working closely with colleagues in this way requires entrustment (Roach, 2012), meaning that each is secure in their distinct role in the collaborative effort of generating truth-making relationships. Entrustment is an experience in difference where each is engaged in a mutual striving toward new selves for all involved.

The possibility of generating such a multiplicity of truth-making relations is already evident in the English academy school in the form of “playful irreverence” to norms and identities (Albrecht-Crane, 2005, p. 494). Power shifts slightly when teachers in the academy take recourse to humor with their “in-jokes” about “Big Brother” and the “Soviet Union.” That such excess is possible, though privately, attests to the flexibility and instability of institutional structures and the possibility of friendship among colleagues as shared estrangement, of community that does not cohere in identity. The opening is a form of relation that exceeds institutionalized utility; a relation of “unbelonging” “generated in common” and which can “regenerate the common” (Roach, 2012, p. 15), referred to in the previous section. What if a few teachers arrive at school with elbows showing and refuse to wear their jackets all day as required? What if someone wears “a jazzy jacket”? We are reminded of tee-shirts worn by teachers, in one school district in British Columbia, Canada, reciting the ironic words of Dr. Seuss’ (1958) feisty little turtle who dared to question the demands of the despotic King Yertle: “I know up on the top you are seeing great sights, but down here on the bottom, we too should have rights” (Phelan, 2015).

In the context of dialog among teachers and school leaders in the staffroom, for example, or at professional development workshops, such playfulness might have a broader application. A playful response at a faculty meeting—spoken in jest but also in earnest—gives colleagues pause, leaving them surprised and even speechless. The assumed consensus is interrupted. Yet the teacher’s joke is not simply negative; it is generative and affirmative because it ushers in other ways of responding to the status quo. Play introduces a difference, an unexpected, unplanned, and unanticipated encounter between bodies and in the moment of mutual discomfort there is the possibility of singular and collective experimentation, other pleasures, other concerns, and other selves.

Reconstituting a relation with self via frankness

In the English academy school teachers feel silenced yet wonder why no one says “no;” teachers knowingly comply but express anxiety in doing so; teachers internalize the external gaze yet openly critique it during conversations with us. The teachers’ utterances suggest a preoccupation with being compliant and docile subjects but they also suggest a struggle against their subjection as such. Teacher’s reflections indicate the possibility of cultivating “a relation of reflexivity” (Halperin, 1995, p. 76–77), “using one’s relation to oneself as a potential resource with which to construct new modalities of subjective agency and new styles of personal life that may enable one to resist or even to escape one’s social and psychological determinations” (p. 76–77). The kind of reflection at play here is one of a “detached and disciplined concern” much like a sculptor stepping back to view her work (Roach, 2012, p. 49).

Friendship as shared estrangement can provide conditions for reflexivity because it relies on frankness or truth-telling (*parrhesia*) in Foucauldian terms. *Parrhesia* is similar to but not the same as conscience; it is a virtue, a quality, and a technique that helps us overcome self-flattery. In a moment of truth-telling, a teacher challenges a colleague, be it a teacher or school leader, to go beyond their limits, their former reliance on the comfort of past practices, for example. As friends, colleagues are confronted with the possibility and the challenge of self-transformation. Unlike confessional discourse that engenders dependence on another (who has power to absolve “sins” or not) and requires the objectification of the self to speak its truth, in truth-telling “[t]he self is not objectified but subjectivated, the self becomes the subject of true discourse and is transformed in the truth’s enunciation” (p. 28). *Parrhesia* must be dictated by generosity and is neither manipulation via persuasion nor imposition of one’s will (p. 26). The intent is to encourage someone toward self-sovereignty and not to provoke “a guilty interdependence” (p. 28). Of course, flattery can also create a dependence whereby teachers rely too much on one another to think well of themselves and to think for themselves.

In friendship as shared estrangement, Foucault marks a shift from a solitary to a collaborative esthetics of existence via *parrhesia*. As an anti-confessional discourse, friendship entails a mutual striving toward new selves (Roach, 2012, p. 37–38); hence there is a different modality of knowledge and a different relation to truth involved. Truth-telling or *parrhesia* involve the obligation to be forthright with the other and to say whatever is on one’s mind.

If the self is only a relation between subjection and subjectivation, then the true friend, the *parrhesiastes*, pushes the subject beyond historical determinants in encouraging “processes of subjectivation over procedures of subjection.”

(Roach, 2012, p. 41).

If teachers are to become friends, in the Foucauldian sense, then each must push the other beyond historical determinants in encouraging “processes of subjectivation over procedures of subjection. The friend is thus the *sine qua non* of self-transformation and immanent salvation” (Roach, 2012, p. 41). Teachers and school leaders compel one another to understand the self and the world in a relational manner.

Friendship as shared estrangement can be thought of as creating the conditions for a “concrete form of freedom”—a place of “extensive work by the self on the self” in the company of others. The goal is to shape “an ethos that is good, beautiful, honorable, estimable, memorable and exemplary” (Foucault, 1997a, p. 286).

Fearless speech among colleagues always carries a risk of course—hurting others by our remarks, damaging a fragile relationship, or losing the friend altogether. Brutal honesty may be necessary because as Forti (2015) argues the root of systemic evil is passivity and obedience, the “normativity of non-judgment,” which arises from the inability to “create friction with the present” (p. 253). Fearless speech requires that teachers be honest with one another and with their leaders, often against their own better judgment about what might be good for them in the future—garnering rewards and recognition; keeping their jobs as teachers; and achieving promotion. The impetus to “stay calm and carry on” is culturally embedded and very reasonable but such desires must become the target of critique if teachers are to defy ethically and educationally unendurable conditions for themselves and their students in the present (Woodford, 2020).

Our point, however, is not to mount resistance to schools as instruments of capital, social engineering and ideological stultification. We are not in pursuit of the teacher hero with a moral obligation to speak truth to power and to save themselves and their students in the process. We are asking, however: “what is it about identities that elicit such strong, visceral, overwhelming responses?” (Albrecht-Crane, 2005, p. 496). Does the identity offered by the English academy school—achievement-oriented, effective, one of us—offer a sense of certainty, safety and stability? Or is it that “the process of identity formation, predicated on a dualistic logic of inclusion and exclusion, makes its way into the body, into the ways individuals govern themselves” (p. 497). Feelings of disenchantment or despair are extremely difficult to live with; the only recourse may be to go along. The same feelings, however, may have a provocative and critical role in removing teachers from the false promise of certainty. In fact, Carusi (2017) argues that the repudiation of their profession—either by leaving it or not recommending it others—is an ethical response to the normative order of effective teaching. Teachers who choose defection or exodus from the profession are critiquing the present—speaking truth to power and about power—and interrupting the smooth functioning of the normative order. In doing so these teachers, many of whom leave with no certainty about what lies ahead, are also “provok[ing] movement without yet projecting a future” (p. 633). Here we witness the politics of friendship as a form of negative ethics.

Conclusion: friendship as a form of negative ethics in teaching

A politics of identity can have a devastating impact on the professional lives of teachers. Friendship as shared estrangement may be one ethico-political response to the normative order of “effective teacher.” Embracing friendship as a politics of the profession constitutes a form of negative ethics.

Friendship cannot be programmed nor prescribed. As a way of life, it is non-coincident with the normative system within which it is embedded. It is an attempt to live suspended between the norm (and actualization on its terms) and a blatant resistance to the norm—a refusal in the form of “I’d prefer not to” (Agamben, 1999). As a negation of the positivity produced by the norm, refusal is an ethical response to and within the normative; however, it “breaks from the normative in such a way that [the] normative order is unable to recuperate that ethical break” (Carusi, 2017, p. 636). Having no content per se, the ethical arrives as a negation to the normative order.

The ethical undoes the context of the normative and actively interrupts the smooth operation of a normative order. The ethical displaces norms and normative orders in ways that “go beyond that positivity” and by “detect[ing] the points it [positivity] fails to constitute itself” (Laclau, 2014, p. 128) we can align the ethical with negativity. The ethical acts against the normative not as a competing positive expression, but as an active “not that”. The ethical is precisely what is unimaginable by and does not follow from the normative.

(Carusi, 2017, p. 636).

Foucauldian friendship—as a form of shared estrangement—can displace but *not* replace norms and normative orders. It offers a radical, but temporary and retrospective, break. There is no logical transition between the political identity of *effective teacher* to experimental relation(s) of friendship as shared estrangement. There is, however, antagonism and provocation. Once we begin viewing friendship as shared estrangement as a new normative—an alternative positivity—it “sheds its negativity and status as ethical” (p. 637). Our intention, therefore, is not to prescribe a given content to teacher identity but to invite consideration of what Agamben terms a “whatever-being”—a whatever teacher, if you will. The term illustrates that it is a being that is outside binary-logics (logics that are installed, for example, by law and norms) and it is a being that is defined in its negativity (“as not”), a being, without a particular identity, personhood, belonging and capacity (Zevnik, 2009, p. 90). Such a being does not make any sense within the existing social and symbolic order. On the contrary, a “whatever-teacher” cannot be grasped within a given educational order because one is not recognizable and cannot be placed either “outside” or “inside” this order. No clear borders between inside and outside can be installed.

In friendship as shared estrangement, Foucault offers a way of life as a practice of freedom that forges a line of flight from the regime of identification as “effective teacher” by creating a critical distance, deflecting commonality and refusing transcendence. His model of friendship becomes “a micro-model for alternative communal and political forms” (Roach, 2012, p. 109) in our schools.

Introduction

Quality of education is political. This becomes apparent when we analyze the history of each word in the previous sentence. During the 14th and 15th centuries, “quality” began to change from something unattainable (as Plato described) to something marking social rank, only to become something defined and measured during the modern period (Dahler-Larsen, 2019, 31–36). In the same period, “education,” alongside the purpose of learning, has become a vehicle for the state to foster economic growth, control key professions, and indoctrinate citizens (e.g., Foucault, 1977; Apple, 1980; Meyer et al., 1992). The massification of education has led Meyer (1986) to argue that education is the “religious basis” of the modern state. What constitutes the “political” is also under constant debate and contestation. In the long view of history, its definition has expanded from distant state affairs to the personal. Thus, quality of education is not only political, but is reforming in the flow of history.

In seeking to understand what quality of education is, it is worth distinguishing between the questions “what is quality education?” and “how is quality of education measured?” In studying quality, an abstract and fluid concept that usually has a positive connotation, one soon discovers that it has no single definition. It sometimes refers to something you simply recognize when you see it (an argument coined by some school inspectors, for example), but this both underlines the subjectivity of quality and its conceptual roots as something unattainable. When quality is operationalized as something measurable, its nature changes. Measurement inevitably changes the power relations between the subjects and objects of measurement, or as Dahler-Larsen (2012) conceptualizes it, creates “constitutive effects.” The politics of quality has observable power effects when quality is operationalized. In other words, the act of measurement makes visible the politics behind the subjective definition of quality.

The concept of Quality Assurance and Evaluation (QAE) has been used to cover the varying array of quality measurement activities, from self-evaluation to national large-scale assessments, and with different purposes, from development to control. When an umbrella concept like this is used, interest shifts to the effects of an array of such different types of evaluation, such as school inspection, auditing, different benchmarks, and indicators. In this sense, QAE is an attempt to combine understandings of the dynamics of what happens when quality is evaluated (Centeno et al., 2018; see Ozga et al., 2011). It carries the risk of essentialization, but it also provides a partner large enough for the concept of quality. We should keep this in mind when examining the different manifestations of QAE.

Quality of education therefore has two important and very diverse aspects: what is considered quality; and how it is manifested in QAE. In combining these two aspects, the understanding of politics from Giorgio Agamben’s *Means without End* (2000, 115–116) is helpful:

What is in question in political experience is not a higher end but being-into-language itself as pure mediality, being-into-a-mean as an irreducible condition of human beings. *Politics is the exhibition of a mediality: it is the act of making a means visible as such.* Politics is the sphere neither of an end in itself nor of means subordinated to an end; rather, it is the sphere of a pure mediality without end intended as the field of human action and of human thought. [Original emphasis]

For Agamben, politics is the revealing of this mediality. Analogically, the politics of quality is making visible that QAE mediates what quality is. When the mediation of what quality is becomes visible, the understanding of quality is no longer something unattainable or abstract, but becomes political and concrete. When we observe what QAE is in concrete terms, and how it functions, we leave behind the idealistic assumptions that quality is good for everyone and its unpoliticized claim. In very simple terms, the politics of quality is understanding what QAE is, and the kind of repercussions it has for action (see Kauko et al., 2018a).

This understanding of the politics of quality is not aligned with the communication of what constitutes quality. Indeed, the usual take on the politics of quality hides its mediality. The current agenda of international organizations working in the field of education is that education needs more quality, and that progress in this can be measured. The Incheon Declaration (2016, 66) by UNESCO, other UN organizations, and the World Bank Group claims that “... research and assessment culture is necessary at the national and

international levels.” Ozga et al. (2011, 2) note that “the integration of quality assurance into organizational ... thinking has interesting implications. Quality now clearly becomes something that cannot be left to chance. ... It is no longer extraordinary. It becomes simply what can be expected. ... Quality is conformity with standards.” For a policy to work smoothly, the politicizing around it should be minimized. In quality of education, the more the technical and bureaucratic dimensions are emphasized, the less room there is to ask “why?”

The two complementary yet opposite understandings of politics of quality, revealing the mediality of QAE and the agendas that cover this mediality, communicate that politics is the organization and reorganization of contingency (Kauko, 2014; Palonen, 1993, 2003, 2006). It is an attempt to channel education policy contingencies with the help of quality. Quality’s positive and malleable attributes make it a fine tool for this purpose.

Education-related testing was already in place in medieval times, for example, in the Imperial Examination in China (Zhou, 2019, 28), but quality as an indicator began to play a larger role in education policy in the Global North during the 1970s and 1980s. The main examples are the foundation of the IEA (International Association for the Evaluation of Educational Advancement) and its evaluations since 1958, the OECD’s (Organisation for Economic Co-operation and Development) social indicator programs during the 1970s and its International Indicators of Education Systems (INES) program from 1988, and the 1983 United States’ Nation at Risk Report. Different countries from every part of the world have steadily followed suit, not necessarily joining the international large-scale assessments, but testing evaluation nationally (Kamens and McNeely, 2010). To name only a couple of examples: Portugal has witnessed a growth in the use of national testing since the 1990s (Carvalho et al., 2020); while following a wave of decentralization in the 1990s, all the Nordic countries rushed toward more QAE with varying intensity (Dovemark et al., 2018). The understanding that education quality needs to be tested and measured is expanding, and it has also reached places previously untouched by the idea of accountability and standardization (Verger et al., 2018). Since the 1990s, southeastern sub-Saharan African countries have started to develop assessment (Kamens and McNeely, 2010). Sahlberg (2016) describes a “Global Educational Reform Movement” that supports competition, choice, prescribed curricula, standardized testing, and privatization. It is fair to say that the global mainstream in education favors more QAE, rather than less. In this model, there are usually elements of accountability, standards, and decentralization.

Drawing on previous projects in which my colleagues and I have been involved, this article takes the examples of Finland, Brazil, China, and Russia to analyze the politics of quality in education. It uses these examples in seeking to understand the extent to which there is a global education quality policy. Except perhaps for Finland, the case countries are not common references in the western literature, but they represent a significant proportion of the world’s population. The main focus is on general school education at primary and secondary levels.

Peeling the evaluation onion

The onion, a simple but versatile ingredient in many traditional cuisines, is a delicious metaphor for QAE. QAE in education has many layers, and their properties and use vary, depending on the context. As with quality, most people would claim to recognize an onion when they see one, despite the richness of varieties. When starting to peel the layers, it becomes clear that the layers are more interesting than its core, quality. Depending on the onion, the useable part can be the leaves (chive), inner layers (common onion), cloves (garlic), or the whole plant (scallion). Onions, like QAE systems, share some properties like layers, but their flavor and use vary according to context. A basic structure of QAE systems is participation in international large-scale assessments, different national QAEs, and regional or local QAE.

Finnish education is steered at the national level, and in the autonomous municipalities at the local level. The post-Second World War expansion, centralization, and nationalization of education faced a new era after the 1980s and 1990s. During this period, the role of the municipalities in education governance became more important as their autonomy was strengthened: It entailed the gradual abolition of school and textbook inspection, and a move toward lump-sum funding for education providers. This was soon countered by an increasing emphasis on local-level QAE, but without directive national guidelines. Currently, the main providers of basic education are the more than 300 municipalities. Kauko et al. (2020) describe Finnish QAE in education as triple layered. The first layer is the international evaluations, in which Finland has been very active. Despite the fame of Finland as a high achiever in PISA, this outer layer is politically detached from the inner national layers. In this approach, national data is considered more important and relevant. In other words, international evaluations are less important for steering than national ones (see also Seppänen et al., 2019). External evaluation’s power is limited in national QAE as well. There is systematic gathering of data as well as frequent and strategy-based evaluations. However, there are no high-stakes test-based institutional accountability measures and no national standardized tests for age cohorts (the standardized general upper secondary exam, matriculation, is an important tool for monitoring outcomes, but not for controlling resources, for example). The remaining tests are sample-based, and their use has followed principles of no public data, no ranking, no standardized tests, and no inspection (Kauko et al., 2020; Varjo et al., 2016). The third layer of self-evaluation by education providers plays an important role in evaluation. They are obliged to evaluate their own education and its effectiveness, as well as to take part in external sample-based and thematic evaluations. In sum, the Finnish layers are rather separate: The international layer has less effect on local-level schooling, national QAE serves as an information provider for national decisions, and local-level QAE is intended to help the local authorities in their work.
